>appreciated.

Well first the bulk of that 150 watts in the PC supply is at 5 volts.
The 12 volt supply capability is probably no more than 2 amps, or 24
watts. That won't power your Alinco. As to how much current the Alinco
draws, *measure it*. That's why meters were invented. It's also printed
in the owner's manual. The 12 volt output of the PC supply is 12.0 volts.
A fully charged deep cycle lead-acid "12 volt" battery actually has a
terminal voltage of 13.8 volts, so your PC supply will never fully
recharge the battery and no overcurrent limiting is required. In fact,
to properly charge a "12 volt" battery, a charging voltage of 14.5 volts
is required. The Alinco is designed with those voltages in mind and
will begin to get squirrelly as voltage drops to near 10 volts as
the battery discharges.

There is a further fly in the ointment. The PC supply is a switcher
and won't work properly unless it is loaded to a minimum current
draw. Basically this means you need to put some big power resistors
across the 5 volt line, and perhaps a smaller power rating resistor
across the 12 volt line as well, to insure proper operation of the
switch mode regulators. The switcher is a RL circuit with the load
supplying the R. Unless a certain amount of R is present, voltage
transients can reach very high levels and do serious damage to solid
state components. All switchers are finicky about their load, and
typical clone PC supplies are particularly cheaply designed with
little or no protection. It's a bad idea.

The local news has been buzzing with the dangers of cell phone the passed few days. They always say that "scientists say there is no conclusive evidence yet but...". I am puzzled other forms of environmentally related cancer takes YEARS (20+) before rises above the "background noise". Seems none of "scare" reporters stop to think about this. Must be blissful to be really technically and scientifically ignorant. :-(

OK, a couple of things.... I know there is nothing "magic" about 455 KHz, but it *is* about the most commonly used IF for HF work. And I was definately oversimplifying whan I mentioned "receivers with a decent front end". What I was trying to imply was that many of the "veteran" HF receivers (SP-600, R-390, HRO, etc.) used a 455 KHz IF and some of them already have IF out jacks, so hanging a DSP box capable of dealing with 455 KHz would "revitalize" these radios like nobodies business. :)
I also realize that, with present technology, dealing with 455 KHz directly is a bit of a stretch. But the technology *is* advancing, and who says the first step can't be a 455 to 50-75 (or therabouts) KHz mixer stage in the interim?

>> "Technician Plus HF" or simply a "Tech Plus."

>So how would you translate this sentence into Politically Correct language?

> "No-code Technicians may not transmit on the 10 meter band."

In order to legally transmit on the 10 meter band, a licenced amateur
must have passed a Morse Code exam at a regular testing session either
when he initially completed the exams required for his license or at
some latter point in time.

The previous sentence covers everyone, no?

There is no such thing as a "Tech Plus" or a "Tech Minus" license, of
course, just Technicians.

Some have passed Elements 2, 3 and 1A.

Some have passed only Elements 2, 3A and one of 1A, 1B or 1C. If they
passed Element 1A, they may be holding CSCEs for successful completion
of other elements.

Some of them have passed only Elements 2 and 3A and may even be holding
CSCEs for other Elements.

I took the test on No Code Tech exam on November 14, 1992. I still haven't received my liscense. Would anybody that just recently received their liscense please post when you took your test, and when you received your liscense. I'd like to know when they get to the tests from November '92. My guess is they're still working on September or October :(

Thanks for any information,

>revealed in the QSO with the break-in.

One of the reasons the State of Illinois stopped giving car license registration information to anyone who called a police station is that in the Chicago area, burglers were sitting on bridges over interstates noting the license plates of obviously loaded autos heading out of town. They would then call the police and pretend to have some reason to contact that person (like that person's car was bumped in a parking lot, etc.). The burglers would then go to the home and carry off whatever they wanted. I am sure there are other reasons of privacy which also added to the change of policy, but this does show that some burglers are intelligent enough to locate homes of those on vacation.

Add to the list of places to not discuss travel plans: cellular phones! There are many scanners capable of monitoring the cellular band. It is more difficult to get information here because the person monitoring doew not have any way to track the caller unless names and/or addresses are given during the call.

>>repeaters or for simplex if necessary. PL encode/decode would be
>>nice, but isn't a must.
>>

Most commercial mobile radios use helical resonators in the front
end, and the resonsators have a limited tuning range. For example,
Micors come in 138-150 and 150-174 Mhz variants. You'd prefer the
138-150 Mhz "split". I've sucessfully tuned a 150-174 MHz GE Custom
MVP down to 145 Mhz, but it was close. I know folks that have moved
450-470 Mhz mobiles down to 440 Mhz, too.

Some mobile radios have highly tuned circuits at the transmitter
output, such as a mobile duplexer or isolator. These can make retuning
a radio difficult. Your common swap-meet radio will probably not have
these items.

>
>My wife and I use some regency UHF synthesized mobile rigs in our cars.

>watt power output, 10 channels, and work just like they disigned to work.

"real" ham rigs usually favor sensitivity over intermodulation and
desense rejection. Most commercial radios have 4 or 5 sections of
helical resonator before the mixer/RF amp. They're very hard to
desense with in-band signals, and nearly impossible to desense with
out-band signals. True, they are a little less sensitive, but if you
live in an RF dense area, they work better. If you live in an
RF sparse area, use a GaAsFEt pre-amp.

13. Microwave tube data

Newsgroup: rec.radio.amateur.misc
Date: 1993-01-28 16:03:45 UTC
From: Peter.Rojsel@maxlab.lu.SE
Message-ID: <930128170345.000011c8.peter@lu-maxlab.maxlab.lu.se>
Source record: 284083

Thanks all who answered. Now I have found the tube data in an old Philips tube data book from 1963. Yes it is sometimes good to save old books. The tube data has the date 5 may 1957 on it.

The 'microwave tube data' hunt is hereby called off. The tube I have is a JAN-725A magnetron. The 'civilian' type number is 725A (surprise!) and it is for 9345 to 9405 MHz. The tube is for pulsed service with a duty factor of 0.0012 (0.12%) and the pulsed input power is maximum 230 kW in maximum 2.5 microseconds. With an efficiency of 40% the output is about 90 kW. The recommended output power is however 'only' 50 kW with a pulse length of 1 microsecond. There is no means for tuning the frequeny of the tube.

This is America, land of the lottery.
If someone sees that they can get BIG bucks with a lawsuit, they try.

If we, as hams, start giving this kind of thing ANY credence, who do you think will be next? Do you want your neighbor to sue you if he gets cancer, just because you've been transmitting with your ham radio next door to him for years?

These lawsuits are a big danger to everyone who uses radios. The claims of them causing cancer are unsupported by any scientific data and are probably unfounded.

We have to do everything we can to convince the public that there is no basis to these claims, otherwise, we may be the next targets!

> how things work. It's handy to have but if you are interested in really
> digging into how antennas work or building your own there are a lot better
> books out there. 73!

I had about the same reaction to the new version of {The ARRL Antenna
Book}.... I've been using an older edition (1982), and bought the
1991 edition a year or two ago. it's about twice as thick, and I
basically assumed it would cover all that the old one did, and about
that much more --- WRONG!!! I'd expected that I could give the old one
away to a new Ham and just keep the new one --- WRONG!!!

as it turns out, my older copy of the Antenna Book is *STILL* my first
reference, and the new one is, well, taking up space on my bookshelf
for the most part.

problems with the new version include things like introducing a type
of antenna (in this case, reduced-size antennas), saying it's better
than another one, and then not going into any details beyond that
anywhere in the book (at least, not that I could find, and I did some
serious digging). I would have liked to know how and why the thing
works, how to build it, how much the size is reduced over a full dipole
(again, this was for a reduced-size antenna), and so on. I guess
someone forgot to do the rest (?).

all I can say is, if you're going to buy the Antenna Book, look for an
old edition first --- it's thinner, but it's got more usable material
in it.

later,

January 29 to February 07, 1993

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

---------

For information regarding our Dynamic Auroral Oval Simulator and its
importance in aiding to determing propagation conditions,
send a request for more information to:
Oler@Rho.Uleth.CA, or COler@Solar.Stanford.Edu

Our Spring Special is now in effect for this software and
will remain active until 31 May, 1993.

---------

SOLAR AND GEOPHYSICAL ACTIVITY FORECASTS AT A GLANCE

DEFINITIONS:

Date (day only)
Possible Magnitude of Solar Flaring (LOW=C-class, MOD=M-class, HIGH=M or X)
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
```

VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

PEAK PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (29 JAN - 07 FEB)

EXTREMELY SEVERE									HIGH
VERY SEVERE STORM									HIGH
SEVERE STORM									MODERATE
MAJOR STORM									LOW - MOD.
MINOR STORM									LOW

Geomagnetic Field	Fri	Sat	Sun	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Anomaly
Conditions	Given in 8-hour UT intervals										Intensity

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

60-DAY GRAPHICAL ANALYSIS OF GEOMAGNETIC ACTIVITY

------------------------------------------------------------
Chart Start Date: Day #335
```

NOTES:
This graph is determined by plotting the greater of either the planetary A-index or the Boulder A-index. Graph lines are labelled according to the severity of the activity which occurred on each day. The left-hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

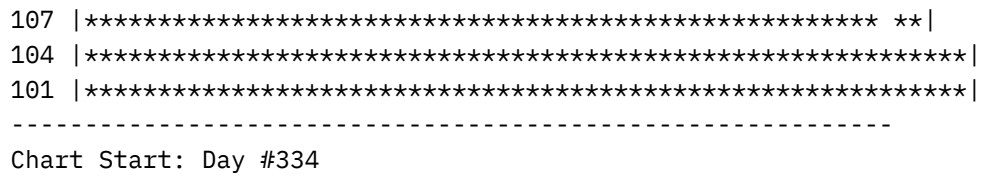
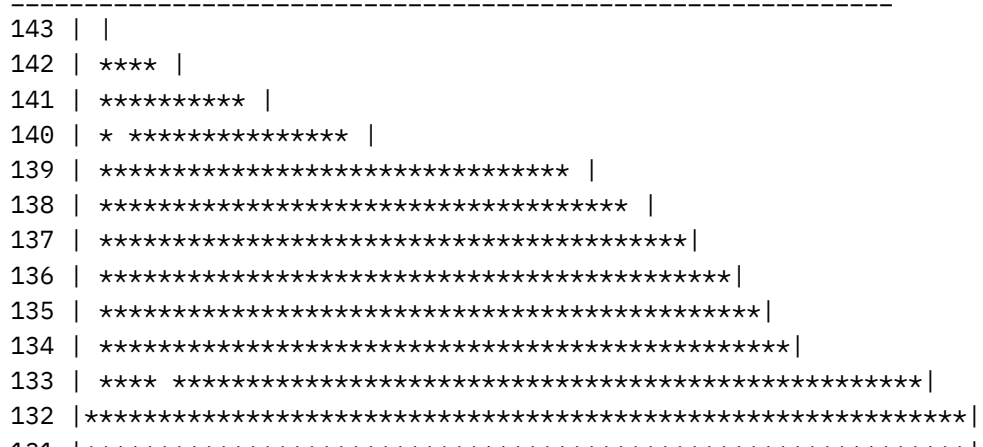


GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

_____	_____		_____

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts.

NOTE:
A Dynamic Auroral Oval Simulation and Prediction Software Package is
available to help make predictions and show the locations where auroral
activity should be visible from the ground. For more information regarding
this software, contact: "Oler@Rho.Uleth.CA", or "COler@Solar.Stanford.Edu".

For more information regarding these charts, send a request for the
document, "Understanding Solar Terrestrial Reports" to: "Oler@Rho.Uleth.Ca"
or to: "COler@Solar.Stanford.Edu". This document, as well as others and
related data/forecasts exist on the STD BBS at: (403) 756-3008.

20. Re: Ham Radio Causes Cancer!

Newsgroup: rec.radio.amateur.misc
Date: 1993-01-28 19:19:29 UTC
From: ham@wam.umd.edu
Message-ID: <1993Jan28.191929.29946@wam.umd.edu>
Source record: 284090

What we have here is a real problem - we are afraid that the general public will become totally paranoid about radio. The problem is the public is, as usual, uneducated about things like radio. So what have we got?

A public that panics whenever it hears that something that is so widely used can make you really sick - or even die. Does the general public have any idea what a Megahertz is? Or what frequency is? Or what different frequencies are used for? And of what each frequency range can do to you?

How many people know what's inside a microwave oven, or what the 101 on the FM radio or 1450 on the AM radio mean? How many people know what frequency channel 6 uses? How many people (besides hams and comm. engineers) care?

The problem is that these devices (TV, Radio, Microwave oven, etc.) are used by millions of people as a part of everyday life, totally unaware of how and why they work the way they do, and how each could potentially injure you if misused.

We hams know that the president of Motorola, upon giving his speech, "Cellular phones are totally safe...", was simply stating in his own way that no CONCLUSIVE evidence pertaining to the safety of 800 MHz RF at a distance of 2 inches from the head has ever been found. Not that some of us don't know better - it's taught in the NOVICE/TECHNICIAN manuals to keep the rubber duck as far from the head as possible, even at 2 meters. I would never use one of those Cell phones, nor would I comfortably use 440 MHz, 1200 MHz, or above without an antenna far, far away from my body. HF is a different story. Limit exposure as much as possible, although the lower energy of HF, compared to VHF/UHF and above, while safer, may still be somewhat dangerous.
It's our job to help those who question the safety of RF to set the record straight. Some frequencies are more dangerous than others.

73, hope I didn't offend anyone,

Scott NF3I

21. Re: FM broadcast station sidebands

Newsgroup: rec.radio.amateur.misc
Date: 1993-01-28 19:33:12 UTC
From: wjc@ll.mit.edu
Message-ID: <1993Jan28.193312.22648@ll.mit.edu>
Source record: 284109

Some details of FM Multiplex broadcasting are being jumbled in this thread.

First, a station transmitting stereo uses double-sideband, suppressed-carrier modulation to put the Left-Right signal onto a *38-kHz* subcarrier. The pilot tone is sent at *19 kHz*. The Left+Right signal remains at baseband. These three components are summed and fed into the FM transmitter. The pilot is used to identify the transmission as stereo and to generate a 38-kHz reference for the Left-Right synchronous (DSB-SC) detector in the receiver.

Second, SCA stands for "Subsidiary Communication Authorization" --- i.e. the station is allowed to transmit additional information besides the main monophonic or stereophonic program. An SCA signal is sent by having the signal frequency-modulate or frequency-shift-key yet another subcarrier which is summed into the FM transmitter's input.

Two traditional SCA subcarrier frequencies are 41 kHz and 67 kHz. The 41-kHz subcarrier cannot be used if the station is transmitting a stereophonic main program. Stations are now also using subcarriers at 50-something and 90-something kHz (I think 53 and 92, I can check if anyone's interested). In general, a station can use more than one SCA subcarrier at a time. Again, if the interest is there, I can post more details on the technical standards.

Typical SCA signals are background music, readings for the blind, stock-market quotations, and paging sequences. The latter two are sent in serial digital form.

Usually SCA signals are not considered free broadcasts; the originator of the signal expects you to pay for its reception. This is why consumer FM receivers (in my experience) do not include SCA decoders.

22. ham software for Apple IIe?

Newsgroup: rec.radio.amateur.misc
Date: 1993-01-28 19:46:47 UTC
From: mitch@cmptrc.lonestar.org
Message-ID: <C1KxLz.Mr6@cmptrc.lonestar.org>
Source record: 284099

Slowly getting my stuff together for my first station. Not only am I going to be borrowing a radio, I'm also thinking about using my wifes old Apple IIe for a logbook. Perhaps packet also. Does anybody know of any Ham software for the Apple II series of computers? Logbooks progs? Packet Progs? any kind of helpful program that a computer can do in a ham shack?

Thanks alot!

C'mon, nobody would do that. It's against the law to listen into cellular phone conversations and the guy who sold me my cell phone said nobody can hear it anyway.

|> batteries. 2 Watts, single band $350

This sure looks a lot like the old AEA DX-Handi... Aren't they made by 'Mitzui' (sp.)? Surplus Sales had a closeout on these a year or two ago for about $150, but I didn't get one. AEA only carried the 6 and 10 meter version.

Has anyone actually used this box? The thing looks so cheezy it's kind of cute! (Tin box with slits cut out for speaker/mike - no nice keypad or LCD display.) I heard a guy on 10 meters a couple of years ago who had one. He was trying to get a WAS with it!

I'll bet the rubber duck works great on 80. :-)

I think people value most the things that are of the greatest *utility*
to them. Having grown up without electricity on demand, I certainly
value that more than anything I "sacrificed" for. Making sacrificial
offerings is a heathen practice of dubious value in appeasing the
powers that be.

Old Wayne seems to ellict strong responses from people that`s for sure!
I think why he does the "I did this" routine is to push other hams to get
out and try doing different things. He is always yelling and screaming for
us hams to bounce signals off the moon and anything else rather then
sitting on the radios for hours ragchewing. I do believe that if we followed
his advice we would all be a lot busier and maybe our lives would be
more fuller. Then again, if we were as busy as he says he is, we'd either
drop dead of overwork or not know our families and friends any longer. 8-)
Wayne makes a lot of good points and sometimes we don't like to hear that.
I do wonder how much of Wayne is real and how much of Wayne is so much
illusion. 73!

>>
>>This is about all we know about RF and its effects upon living tissues.
>
>This statement sounds like an "Adairism" if I have ever heard one. You
>are WRONG, my friend.

David, your uncritical acceptance of media pseudoscience is touching.
However, correlation is not causation, and even the evidence for
correlation for non-thermal effects of UHF RF in this case is non-existant,
and the correlation found in an epidemiological study of amateurs using RF
of unquantified frequency and intensity, with no controls for frequency or
intensity of exposure, or for other occupational or lifestyle factors, are
hardly above the statistical noise for the small samples studied *if the
correlation exists at all*. Monte Carlo simulations show similar false
correlations more than half the time.

Some very interesting *science* has been done studying the possible effects
of ELF energy on the electrochemistry of living systems, but there is no data
to show that these effects also occur at UHF. The mechanisms discovered
don't support it. The fields at UHF reverse much too quickly for the ions
propagating across membranes to respond.

As John says, we don't know of any non-thermal biological effects of UHF RF. They *may* exist, but there are no epidemiological studies that show strong correlations, nor is there any scientific evidence of a mechanism by which causation may occur. We shouldn't forget how media science condemned cyclamates based on mere correlation only later to discover that the correlations were flawed and the mechanisms were dependent on dosages beyond all possibility of actually occuring in practice. Even the EPA has had to backpedal with respect to their initial condemnation of dioxins, and the whole field of low level radiation exposure is rife with controversy.

What we do *know* is that thermal effects at high power densities are real, so we should avoid them. What we also *know* is that any secondary effects are smaller than other risk factors we face daily, otherwise amateurs would all be dead from cancer already. Since we obviously are not, and amateurs as a group are elderly with long exposure histories, we can with confidence state that any possible non-thermal risks are small.

Source record: 284112

Isn't it about time the subject of 'Code VS No-Code be allowed to die a natural death?

What's the point of arguing the merits or lack of merits for CW or No-Code. No-Code is here to stay, and legal(I'm not a big fan of No-Code)! It's not going to go away by complaining about it. FCC/Washington DC says so! Relax and ACCEPT the fact that it's here to stay. If you can't accept it, there's not a lot (constructive things, anyway) you can do about it!

I'm not a heavy CW type, but enjoy it occasionally, as I would a comfortable old chair. It's low-tech, needs no exotic equipment, and is a skill that once learned really is fun to use. It's like an old Model T car. Sure it's outdated, but it's still fun to drive. And the argument that CW is NOT outdated is correct, too! Personal points of view are legal, remember?

And for you Anti-CW types, why bitch about a mode you aren't going to use. If you don't see it's purpose, then don't complain about it's useage, because there are others who can and do see CW's purpose. If you have trouble agreeing that their purpose is valid, well, that's just life. No one ever said we all have to agree with you (or me!).

I personally liked the CW requirement to keep the 'ham club' somewhat exclusive. For many years, I knew enough to pass the written general class exams, but the CW requirement was something I hadn't worked at hard enough to pass. It took a while, but I finally did get to work and finally passed the CW requirement. It was tough, but it was rewarding and a real feeling of accomplishment. It's well known many people are/were in that same predicament, not wanting to take the trouble (and it is a fair bit of effort) to learn morse code well enough to pass the 5 WPM or even 13 WPM requirements. I personally think if you want to get into a hobby/trade/profession badly enough, you do have to be prepared to work for it.

Since you no longer have to learn CW to get a Technician license, it does seem to be too easy to get a ham license. You don't have to 'pay your dues' by learning CW as most did. And it's understandable having the bad feelings about 'Well I had to learn it, and I don't like that others can now be a ham and not have to go through the endless hours of learning the 'dits' and 'dahs' like I did, it's just too easy, now'.

The point is, No-Code is here to stay, like it or not. Don't waste the energy by flaming each other continuously, the No-Code types VS Code types.

What I cannot accept is the constant bickering on this BB regarding CW. What's the point? Knock it off!! What can one hope to accomplish by bitching about the no-codes, or bitching about the CW types belonging to an extinct age (not true).

Some EXTREME no-code proponents sound as though they would BAN CW if they could, because of it's less efficient spectrum usage. That's the argument they use, at least. If they had their way, many no-code types would like to ban CW and demand all hams go to the more efficient (uses of radio spectrum) emissions such as that used by packet. Those are very often computer 'geeks' who honestly have trouble communicating with other humans except via keyboard. They have no conception of the earlier 'romance' of the various non-digital (I.E. read AM, SSB, CW) modes.

They would, if they could, ban the 'non-efficient' modes they don't like. And many people don't like what they don't understand, couldn't master, no interest in, or whatever (I.E., CW).

Ham radio, if you didn't know, is a huge assortment of old and new technologies, including digital (packet, etc.). Those modes are what make it a very rich and rewarding hobby....enough modes to always keep you learning if you want.

If you aren't into CW, what is your REAL purpose in bashing it. What is the harm of people doing CW, or even AM? None! It's all part of the rich spectrum of activities. So what if it takes more spectrum? Rarely, except in the case of contest times, is the total ham band fully in use. We have spectrum to use, we need to use it to keep from losing it. I suspect those who say CW is inefficient and should be banned are the same types that would ban the driving of old classic cars and airplanes because they can't pass the smog test! They don't understand, they just don't understand. Intolerant, too!

And for the people bashing No-Coders, (I would probably have voted to keep the CW requirement, to be honest), lighten up and forget it. What's the use of bashing them. It's OK to not like the fact that No-Code was passed, but what does it accomplish to keep complaining now that No-Code is here? Not a bit of good! It certainly doesn't help the cohesiveness of amateur radio. It only divides ham radio against itself!

It certainly doesn't help ham radio to be bickering among ourselves, this is supposed to be like a fraternity of people with similar interests (technology, radios, communications, friendship!)

How about accepting No-Coders, CW, SSB, AM, RTTY, Packet, X.25, FM, etc., etc., and getting on with our amateur radio lives. After all, a person can get an ulcer by worrying about something he doesn't have a lot of control over!

PLEASE, Wayne Green, I hope you're reading this!

If Wayne Green could stay on subjects related (or even remotely related) to amateur radio, I could probably stomach his LOOONNNNGGGG-Winded tirades/editorials.

I am so sick of hearing Wayne Green brag about his record companies he started, what he did in the US Navy, how he started all these other magazines, how he invented this, and how he invented that, how he started this technology, and on, and on, and on,..... I could just scream! Wayne's ego doth preceed him!

The rest of the magazine is great!!! It stays away from those incessant contests promoted by 'CQ', and stays on the typical amateur radio activities.

I am looking for a tutorial on building a QRP transmitter.
I would like to build one for the 15 meter band, and would like
its construction to be as simple as possible. (The "cubic incher"
in the ARRL handbook would be one such example of the complexity and
capability that I am looking for.) The goal of
the project is more to learn how a transmitter works and have the pride
of getting something on the air that I built myself, than to work DX.
Therefore, the more thorough the theoretical explanations,
the better.
Any favorite articles on simple 15 meter transceivers
would also be appreciated.
I hope I have given you all a good enough idea of what I am
looking for. Thanks for your patience.

There is much to be said for buying a 3 to 6 AH sealed lead acid
battery at a hamfest. While the pricey HT battery packs like Quantum
look neat and will hold up well, for $20 you can get more AH
if you're willing to give up some aesthetic appearance and carry
some weight around.

Whaaaa! This sucks! I've had my DJ580 for weeks and weeks and no license yet! I've not experienced the pleasure of "trasmission" (except for those occasional (purely accidental, mind you) blips on the PTT button that trigger the oh-so-sweet sounding repeater ID. ;). I took my test 12.2 I believe. Nothing yet. :(

Nahh, I've got the solution. Try a Collins R-390A, teamed up with a Johnson Viking in a nice military steel rack cabinet. I'd just like to see them try to steal it. It took six people to lift it up the front steps.

I think you guys are being silly! There are many ways a person can determine if a house is occupied, without listening for hams on the radio.

While it's probably not a good idea to discuss your vacation plans on the radio, there is absolutely no evidence to link the information revealed in the QSO with the break-in.

[By the way, Mike, my cat was an effective deterrent. If someone came to the door, it would run though the house, turning all the motion-sensor activated lights on. I used to have a motion-sensor at cat height near my inside front entranceway. When I pulled in the driveway, the light always went on.]

>very much.
>
>Thanks and 73 de Sven
>
Hi,

I have used the 9020 backpacking, mobile, and at my home QTH.

I liked it so much I wrote an article for QST about
some of my experiences with it (FEB QST 1993..new section).

The filtering is great, the rig continually gets me good
reports from other stations. I have worked all over the
world and the country with it on a portable dipole. Very small
rugged, and very easy to use. No problem plugging it into a
cigarrette lighter and using it mobile with a Hustler vertical.

I had one of the earlier rigs. The audio was a little weak,
and after I had it out in the car for a few months during very
cold WX, the sidetone went a little crazy and it drifted. I sent
it back to MFJ the week before christmas. shortly after I got
a note saying it had been received, and it could take up to
4 weeks to return to me. the week after Christmas my rig was
returned (about 7 days) They had changed out a number of components
put in a bigger speaker and new top case. I figured that they
must have updated mine. It has been working great since
I got it back. I was very pleased with the warranty service.

I added the internal keyer and it works very well. The audio isn't
real strong, but certainly acceptable.

This little rig is one of my favorite toys. I have it sittintg
next to my Yaesu 757 which can do QRP and works great. Most
nights I use the MFJ.. I picked up a mini straight key at the
last ham fest and can leave the paddles (homemade) and the
straight key hooked in all the time.

I love it. I feel it was certainly worth the money.

Subject: Future of Ham Radio
To: info-hams@ucsd.edu

With all the ravings about Nocode pro and con I started thinking about
the future of Ham Radio. With the HUGE influx of the Nocode Techs the
hobby is now growing at about 10% per year. This translates out to the
hobby growing from the current level of 600,000 hams to about 1.2 million
in 7 years. Like anything it will slow down it's growth after a while.
What does this all mean? The market for new and used gear will explode!
There will be more manufacturers producing gear and as much as some people
oppose this, prices will finally drop! As the market for 2 meter gear has
shown when competition arrives, prices start to drop or more features are

added for the same price. In recent Ham Radio magazines there are appearing more and more new advertisments for various niches of the market. Heathkit pulled out of the market (bright move that) but it's been amazing how many new companies have poured in to take it's place. JCOM has just brought out a series of new QRP SSB 2 watt single band transceivers that are $349.95 for 6 thru 80 meters. They also have a 10 watt linear available. Can't afford the high priced HF rigs? Get one of these. Interesting to see DSP products showing up now and once others start showing up prices should drop there also. As the market grows and grows at it's current rate Ham Radio magazines might even start looking like some of the Japanese 2 inch thick Ham Radio Magazines. Drake bought out a new HF receiver for the market and Atlas bought out a new low priced HF transceiver so some of the old boys are showing up again! The Nocode tech is what is driving all this and as such Ham Radio should be thankfull for this new license! Any comments anyone? 73!

Subject: Ham Radio Causes Cancer!
To: info-hams@ucsd.edu

Speaking of ham radio and cancer, I'm sure many of you have seen the news coverage of the lawsuit accusing cellular phones of causing cancer. I saw a report of it last night on NBC. I must say, I have seldom seen a more inaccurate and misleading report. Showing people using cordless phones (implying they were cellular phones) was bad enough, but claiming that cellular phones emit 'high energy microwaves just like microwave ovens' was too much. I guess it's a bit naive to expect accurate coverage of something as technical as cellular phone technology but one would think they would at least make the attempt.

Mike,

mic socket: Pin 1 mic i/p
2 ptt
3 n/c
4 ground

The crystals depend on you! Icom had 6 standard crystal options, two of
which were installed (144.0-144.4). I will guess that you want 144.4 to
144.6 (mixed-mode) and 145.8-146.0 (space comms).

Well, I'll just post all of the optional crystals that Icom made:

Centre QRG Fundamental QRG
144.5 14893.28 kHz
144.7 14915.50 kHz
144.9 14937.72 kHz
145.9 15048.83 kHz

All are type HC-25u, and CL = 20pF (load capacitance).

Note that Icom state you will probably need to realign a number of stages if
you install the crystal for the top 200 kHz of the band, in addition to the
frequency determining caps/coil.

Good Luck!

Subject: HT power supplies - call for preferences
To: info-hams@ucsd.edu

Being a new HT owner, I have a general question to ask regarding personal
preferences for HT power supplies. I have an Alinco DJ-580 with the
standard 7.2V NiCad rechargable pack which allows me up to 2W output.
However, I've noticed that even without transmitting my battery only lasted
a few hours (maybe 5). That seemed unreasonably short for not even
transmitting, as I was expecting something along the lines of twice that
with intermittent transmit. Of course then, I am new to the HT world.

So my question is this - to the experienced HT users out there, what are your preferences for power supplies? Of course a great solution is to get a link to my cigraette lighter for 12V and full output power (5W) and a great supply. Also, there are AA dry-cell (6) packs for AA NiCad rechargables or alkalines - which I am definitely getting as soon as it comes back in stock at my local ham shop, though they still provide only 7-9V and hence little if no improvement over my 7.2V NiCad pack (rechargeability-in-the-field issues aside).

There also is the 12V NiCad rechargable pack offered by Alinco, which is bulkier and costs $65, but would power my HT up to 5W and provide me with a longer supply of power than my 7.2V pack. Furthermore, I have heard good things from some hams about the Quantum 12V ham power supply - the same company that makes them for camera equipment. The Quantum pack may be a lot of dead weight, and at $145 isn't the cheapest available, but I hear it is by far the strongest and most reliable battery supply available - however there are tradeoffs and practicality issues (eg. - when is an HT loaded down to where it is hardly a portable HT anymore?, etc...)

Please post or e-mail me your responses to: gregs@slc.slac.stanford.edu.

Thanks and 73 -

>
> [etc ...]

The best parameter to evaluate how long a battery will last is its capacity (typically measured in mAHr or AHr), not the pack voltage. I have found for various Icom rigs (2AT, 2SA, 2GAT) that a 300 mAHr pack lasts from 8-10 Hr if the battery saver is enabled, mainly listening, with maybe 5% Tx. Using high or low power makes little difference at this low duty cycle.

Getting a high voltage pack seems like quite a waste to me, as it
typically halves the battery capacity and the extra 3-4 dB of power
very seldom makes a difference. For long life on my 2GAT I use a
hi-density BP8 (1200 mAHr, 8.4 V) which lasts 40-50 hours use, while
for a more convenient size, I use a 600 mAHr, 7.2 V BP2.

Most of the time, the best battery to use is the smallest one that
will last a day (though it is a good idea to have a spare somewhere!).
Giant packs and external supplies just turn a convenient handheld into
a poorly performing mobile.

Subject: I love/hate Wayne Green!
To: info-hams@ucsd.edu

As soon as I get my new issue of 73 magazine I sit down and open it
up to Wayne Green's editorial! I always enjoy reading what he has to
say and even if I don't agree with him it makes for a good read. Wayne
and I are on different ends of the political spectrum but he still makes
a lot of sense at times. He always gives you the impression that if he
was in charge the world would be a perfect place and that K1MAN and the
mess on 14.313 would be in a deep dark hole somewhere. He always me think.
By the way 73 magazine seems to be getting really focused on construction
articles which I really like! He also just wrote that he had his circulation
audited by ABC while none of the other mag's would do that and that those
others might be fudging a abit on their circulation numbers. Interesting...
Anyone have any comments on all this? 73!

Jeff

It most certainly is, Jose! While I'm not a DX'er by any stretch
of the imagination, I do in fact enjoy collecting QSL cards from
DX stations that I've worked on the various Amateur Radio satellites.

In fact, I just received a card from HS1JC in Thailand for a Fuji-
OSCAR-20 contact that we had last month.

There's LOTS of DX on the satellites, and it's entirely possible
to work well over a hundred countries via the satellites now.

By the way, the ARRL has recently changed its VUCC program so that
satellite contacts are allowed. That makes the chasing of grid
squares on satellites an attractive and exciting aspect of Amateur
Radio operation.

Subject: Using electrical outlet ground as earth ground?????
To: info-hams@ucsd.edu

In <1993Jan27.113234.5504@klaava.Helsinki.FI> stickler@klaava.Helsinki.FI
(Patric M Stickler) writes:

>Does the ground socket of an electrical outlet provide a good (or at
>least reasonable) path to earth ground? I.e. would I be able to hook
>up a three prong grounded plug with the two hot prongs removed in
>order to connect my rig to earth ground via the electrical outlet?

The problem with using the ground terminal of the electrical outlet
as a transmitter ground is that while an ohmmeter may show the ground
terminal to be identical to a pipe driven into the ground, at RF
frequencies the two are not identical. The quarter mile of wire
between your ground terminal and a "real" ground, such as a pipe,
goes around corners and is not very thick. It has portions that
act like inductors, portions that act like capacitors, and portions
that act like antennas.

You can try it and see, of course. If it works then who cares?
And if you are on the sixth floor of a building it

may be your only choice. But a wire as thick as a car-battery cable
running from your rig to a pipe in the ground is better.

Subject : Re: Real NoCodes

Instead of this childish name-calling, why don't we have a bit of fun
instead, and turn the list around? Something like:

Real OldFarts think CW is the only efficient means of communications,
even though advances in DSP technology have long since overtaken them.

Real OldFarts think that CW ought to be retained, because one day you
will need it to join two wires together following an aircraft crash.

Real OldFarts think that CW will never die out, even though they are just
about the only people still using it on a regular basis.

Real OldFarts think that CW is the only way to pass traffic, satellites
and wormholes etc notwithstanding.

Real OldFarts believe that everybody ought to do CW, because _they_ did.

I'm sure we could think up a few more... And how about "Real Extras ..." ?

[info on Diamond RH-77B sucking deleted]

Your mileage may vary.. I've got an Icom dual band antenna (same
one supplied w/W2A) and while it works well, it doesn't even come
close to the Diamond. Maybe you were in a strong signal area
and had desense problems with the Diamond antenna installed.

51. Weather Satellite Transmission Recording

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-15 03:49:09 UTC
From: roland@quadsys.com
Message-ID: <C3wvxx.3zC@quadsys.com>
Source record: 283903

I'm in the process of building a weather satellite decoder and would like to test my design. I havn't gotten the receiver up yet (and still need to build the antenna), so I wondered if someone out there would be willing to send me a cassette tape recoding of a Meteor, COSMOS and WEFAX signal recording?

I would, of course, cover any expenses. A standard cassette or, better, microcassette would be great.

Thanx

From: roland@quadsys.com
Message-ID: <C3ww3A.406@quadsys.com>
Source record: 283902

I am building a decoder for analog transmissions from weather satellites.
The literature I have read also refers to the satellites transmitting
higher-resolution images in digital format.

Does anyone know where I can find out more about the digital format and
frequencies used?

Thanx

--

Source record: 283886
Cross-posted to: rec.radio.info,rec.radio.amateur.misc

DX Bulletin No. 103
March 15, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, ARRL DX Bulletin, DXAC, AD1C, K1ER, KA1NCN, NA2M, WA3CGE, K4CEF & Southeastern Cluster Group, WS7I, W8GIO, KF8VW and HB9BCK for the following DX information.

THIS WEEK'S HOT RUMOR! It was reported on a DX net that Romeo (3W3RR) will be active in the near future from 5A (Libya) and 3V (Tunisia).

1S, SPRATLY ISLAND. The latest word we have on Spratly is that the trip is definitely still on, but it has now been delayed until April. A few reasons were mentioned, one was so not to conflict with any other DXpeditions (presumably the KH5K and KH5 operation). The second reason that was mentioned for the delay was the landing paperwork was not totally in order and Martti (OH2BH) had requested everyone to plan on delaying the trip for this reason. Stay tuned for more details as we hear it.

5R, MADAGASCAR. Frank (DL7FT) is currently active as 5R8DJ until March 28. He was quite active on 28490 kHz around 1430z this past weekend. Look for him on these other frequencies: 28005, 24940, 24898, 21005, 18145, 18080, 14005 and 10101 kHz. There were no low band operation mentioned. QSL vi DL7FT.

5X, UGANDA. A station signing 5X1A showed up March 9th on 21232 kHz and was active for a few hours. The operator stated his name was Bruno and to QSL via DL0MAR. It was also reported that Mario (5X5MB) was present in the room.

BY, CHINA. It has been reported that BY1QH is now active on 12 and 17 meters. This should be the first WARC activity from China. There have been no signs of CW activity as of yet, but supposely BY1QH is using a GP vertical and a TS-440s on these bands.

C9, MOZAMBIQUE. The Mozambique government has restructured their call signs and has issued new call signs for their 6 providences. The new prefixes are C91 thru C96 with the other remaining prefixes used for special events and VHF only. The following operators and club call have been changed: C9RJJ is now C91J, C9RDM is now C91S and club station C9TDM is now C91TDM. W8GIO continues to serve as QSL Manager for C91J

and C91S ONLY. Cards for C9TDM go to: POB 25, Maputo, Mozambique.

HB0, LIECHTENSTEIN. Albert (HB9BCK) will be active from April 11-17 as HB0/HB9BCK/P. He plans to be active on CW/SSB and RTTY/AMTOR/PACTOR using 80/40/30/20/15/10 meters. He also plans to be show up on the Family Hour DX net at 1800z. QSL via HB9BCK, Albert Zaehner, Scherzinerstr. 23, CH-8595 Altnau TG, Switzerland or QSL via the HB9 bureau.

HC8, GALAPAGOS ISLANDS. Jay (WS7I) reported to OPDX that Betsy (WV7Y) and himself will be traveling to join HC8A. They will be very active on RTTY and probably 6 meters. Their callsign will be HC8J and they plan to operate March 20-21 in the BARTG (British Amateur Radio Teletype Group) RTTY Contest. QSL via WV7Y with a SASE (NO bureau cards). They plan to be there until the 27th of March. Jay mentioned HC8A will be active in the CQ WW WPX SSB Contest with Rich (N6KT), also QSL via WV7Y.

S2, BANGLADESH. Three new stations have been active all week. Look for S21ZK, S21ZL and S21ZM. The ops have been reported as UB5 operators. The stations ZK and ZL seem to be active mainly on 18 and 24 MHz, while ZM is active on 7, 14 and 21 MHz. The length of their stay is unknown. QSL all three to SP5IUL.

MORE ON FIELD CHECKING. Bill (NA2M) informed OPDX that there are a few changes and errors in the latest Field Checking List and DXCC List.
A6, U.A.E. - Now has a black dot next to it, which means it can be field checkable. The September issue did not have it.
HI, Dominican Rep. - Has no black dot, meaning no more field checks, however, this is an error. It is still field checkable.
4N4, Bosnia-Herzogovina - This is also field checkable and is listed as 4U4, change to 4N4 in the listing.
Added note: The former "U" prefixes for Lativa (YL) and Lithuania are still okay for field checking.

CHANGE IN DXCC COUNTRIES LIST. The ARRL DX Bulletin this week announced that on March 10 the ARRL Awards Committee voted unanimously to accept the DXAC recommendation to delete Abu Ail Islands from the DXCC Countries List, effective March 31, 1991. The reason for the deletion: "When the Red Sea Lights Company relinquished control of the islands on that date, they became unadministered. Because of this change of status, the area now falls under Point 4 of the Countries List Criteria."

DXAC HAPPENINGS. The petition for the deletion of Mount Athos has been removed from the DXAC agenda as requested by the petitioner. DXAC member Bob Parlin, W0SFU, has been replaced by Vern Veenhuis, KU0S, representing the Dakota division.

A SPECIAL OPDX BULLETIN: The results of the OPDX/NODXA 1992 DX Survey, that was taken December of 1992 thru February 1993, will be released sometime this week.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates only Class 2 Fax. Use only the dates and times specified. The FAX card is

sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as
OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS
online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with
the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send
BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to:
DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA (pm)

55. Re: Repair my HW-101??

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-15 16:17:32 UTC
From: m14494@mwvm.mitre.org
Message-ID: <1993Mar15.161732.19654@linus.mitre.org>
Source record: 283884

☐Mark Bagdy writes:
> I would like to know your opinion of fixing up my old HW-101.

Speaking as a former HW-101 owner, here's the Official
repair technique for all "Hot Water" gear:

1. Buy a 1957 Buick RoadMaster
2. Put the rig on the ground behind the rear wheels
3. Put the transmission in Reverse
4. Gun the engine
5. Pop the clutch.

I jest of course; I have fond memories of all my Heathkits,
including the HW-101. If you can fix it up cheap, it's an
ok rig that will get you on the air. If the repair costs much more
that about $50-$60 or so in parts and bother, I think it's probably not
worth it. Clean HW-101s in good working order go for
not much more than $100 at hamfests. Good luck.

Mike, N4PDY

57. ALERT: Minor Geomagnetic Storm Alert - 15 Mar

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-15 17:31:12 UTC
From: oler@rho.uleth.CA
Message-ID: <9303151731.AA07798@rho.uleth.ca>
Source record: 283885

/\

MINOR GEOMAGNETIC STORM ALERT

ISSUED: 14:00 UT, 15 MARCH

/\

ATTENTION:

A sudden storm commencement was observed at 05:26 UT and measured 20
gammas by the Boulder USGS magnetometer. This marked the arrival of the
anticipated disturbance launched by the last M7.0/3B proton flare. The
disturbance was tardy. Geomagnetic activity increased following the arrival
of the disturbance to major storm levels. Major to severe storming has been
observed over the high latitude regions. Activity surpassed the minor storm
threshold at 12:00 UT on 15 March and is continuing in progress. There is a
small chance this storm may be upgraded to a major category event.

Activity is expected to remain at mostly minor storm levels with periods
of major storming possible over the next 12 to 24 hours. Stabilization
should begin to set in on 16 March.

HF radio propagation conditions deteriorated with the arrival of the
disturbance. Strong fading, multipath activity, and absorption has been
observed with this activity. Night-sector propagation above 10 MHz has been
difficult. Transpolar and transauroral propagation has suffered the most
severe signal degradation. Day sector propagation will be the most stable.
Expect similar conditions to persist for the next 18 to 24 hours (until
approximately 15:00 UT on 16 March). Improvements are expected thereafter
over all regions. Gradual improvements may be realized over the low and
middle latitudes by the end of this UT day, although night-sector propagation
over these regions will remain unstable and below-normal.

** End of Alert **

In rec.radio.amateur.misc, britton@psi.llumc.edu (Barrie Britton) writes:
>In reading the recent spate of complaints concerning the preceived lack
>of customer service at various HRO, Radio Shack, Sears, and other retail
>stores, I am amazed at the high level of customer frustration expressed.

I'm certainly no expert about retailing--I don't work in it, thank goodness--but it seems to me that over-the-counter retailers are between a rock and a hard place. On the one hand, they have to keep their prices within at least striking distance of the mail-order places to avoid the "see it at the store, buy it by mail" syndrome. On the other hand, face-to-face customer service is a lot less efficient than phone service, so their labor costs drive them right out of competitiveness unless they hire slave labor. And hiring cheap labor ultimately demonstrates the old maxim that you get what you pay for.

My approach has always been *not* to count on getting much help from the store staff. About all I expect them to tell me is what's in stock and what they are asking for it. Most salespeople--in just about *any* consumer business--don't really know much technical detail about the products they sell, and they sometimes get surly if you demand answers they can't provide. Besides, their job is to close sales. They have *their* best interests at heart, not yours. To the extent they can align their interests with yours, smart retailers will do so. But when push comes to shove, putting food on their own tables is what motivates them. So, I find out as much as I can about the products I'm interested in *before* I go to the store. Then I just ask to be let alone to examine the stuff to make my decision.

Gee Jerry,

I know I would have a problem traveling over a thousand miles to an event of this type and then end up at the YMCA, or worse yet, up all night at Denny's.

You can keep your seat of the pants traveling methods. I'll stay home until I have a reservation booked and confirmation number in hand.

Have a nice day.

Will

Dunno, but one of the military bases on the current shutdown list is
Vint Hill Farms here in Virginia, which a lot of the numbers transmissions
have been DFed to. If you notice that the beam they are coming in from
changes radically in the next year, you'll know why.

Gary, you need to loosen up your imagination a little bit. Suppose one wanted to use their fancy 2m HT as the basis of a 1296MHz rig. They could connect the 2m HT to a transverter that would translate its inputs and outputs to/from 2m to the 1296MHz band. In an application of this sort, the user would want as large a transmit range from the HT as is possible. Nothing immoral about this in your philosphy is there?

> performance?

NO NO NO NO NO NO NO

The loss in transmission line is a function of the di-electric material.
the di-electric in open wire line is air. This is the best you can have
- other than a vaccuum. Using co-ax as you have asked will give you a
balanced line, but the losses will be the same as using co-ax.

Contrary to popular belief, open wire line (when terminated in a balanced
load) will NOT radiate, even with a high VSWR. This is because the the
currents in the wires are equal and 180 deg. out of phase. The signals
radiated by each of the wires will be canceled by the signal radiated by
the other wire. A tranmission line works by guiding a field from the
source to the load, and the field around open line extends out from the
line by approx. the spacing between the wires, so the line has to be kept
away from everything for its entire run.

I could write a book about this !!!!!

65. New AEA unit - replace PK-232?

>This is what we have come up with so far:
> a) We will have to buy 75 ohm connectors (probably N) for the hardline ...

Yeah, and they are expensive. The 75 ohm connectors have a smaller diameter center pin than 50 ohm. You can't plug a male 50 ohm into a female 75 ohm without distorting the female center pin. I have seen a number of homebrew adapters for 75 ohm hardline. What I once did was to use a double-female (barrel) UHF connector. Its outer diameter was the same as the OD of the hardline I was using, and the center pin was a nice press fit to the hardline center conductor. I used a pair of hose clamps to clamp a small length of aluminum pipe over the connector and hardline and then weather-proofed the whole thing with epoxy.

>Our options include:
> - Use the coax as-is. ...

> sensitive, with a center frequency and poor performance on band edges?

They are probably 1/4-wave matching sections, which would be frequency-sensitive.

What I did is a combination of your second and third alternatives. To tune the antenna for 75 ohms, I temporarily connected a 150-ohm non-inductive resistor in parallel with the feedpoint and tuned for lowest SWR on a 50-ohm SWR meter.

At the radio end of the coax, I built a matching network in a minibox. I used a simple "L" network with L and C selected to match 50 to 75 ohms. It's plenty broadband enough for a ham band.

Seems like the 2 meter version should also work on 432 MHz. (3/4 wave
is an odd multiple of 1/4 wave.) Then you could use the same coax for
both bands, with an antenna switch up on the tower.

68. HTX-202 MODS ??????

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-15 20:58:42 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9303152100.AA03759@netmail.microsoft.com>
Source record: 283952

Running a htx 202 here and I don't have the squlech poping problems you describe. Does this only occur with SAVE on or not. Perhaps you have a defective unit (missing a cap for sequencing?).

I can't think of any mods that would appeal to me -- it does everything I want and I can't imagine adding anything to it (and given the surface mount construction I don't think I'd want to do much!).

In article <fred-mckenzie-090393125719@k4dii.ksc.nasa.gov> fred-mckenzie@ksc.nasa.gov (Fred McKenzie) writes:

>Let's take another look at the HTX-202, and see if there are things that

>doesn't mean improvements can't be made.
>
>How is the audio frequency response? Is there distortion on strong
>signals? Is the internal speaker loud enough? Is there a better speaker
>available that will fit in the case?

The rig is the most immune HT i've used (excluding older 2AT style). It was a major consideration for me as I live on the top of a hill 1/2mile for several major FM and TV TXes serving the Puget Sound. The hill also has its usually collection of commerical, amateur and PS repeaters. I have noticed no spurious signals due to intermod/overload. Every other radio (AM, FM and ham) in my apartment suffers some problems from these transmitters (normally frame sync buzz in AF amps -- DC RXes are the worst!).

The internal speaker is plenty loud enough even for in car use. If you are using it in a noisey car (like I do in a 1967 SAAB 96) I recommend an external speaker close to one's ear. Have you listened to one? Its well above the audio of the "tiny" machines now avialible.

>How about transmit audio?

I have gotten good reports -- good deviation, loud and clear. I have yet to monitor it myself.

>How stable is the master oscillator?

Good enough for FM but I've not taken it to temperature extremes yet.

>If the battery pack goes bad, does anyone sell refill kits?

The batteries are the same as the ICOM AT series (BP series packs). Both packs, replacement inserts and drop in chargers are avialible from many nicad resellers. Does anyone do BP style packs with metal rails

battery packs like come with the original 202?.

The htx202 is a well designed piece of equpiment (an order of magnitude away from the usual RatShack trash). It is better built than the htx100 10m rig. It is well thought out, not excessive in features, but they picked the right feature set to the average user. Splitting the memories into calling channel (it is easy to flick between the calling channel and vfo or a memory channel with the press of one button), 3 priority memories, and 12 regular memories is a good idea. This matched my usage closely (I listen to three repeaters on a regular basis and others ocassionally).

I returned the first rig I got (scratches on the back and a missing screw pointed to someone having taken a look inside and the charger failed on first usage). This rig reset to 144.200. The second rig I got was fresh out of the box. Reset of power up to 146.000 -- so I presume Radio Shack updated the ROMs to get it to come up at a more reasonable frequency. For american use 146.52 would be nice (but this would be out of band in other parts of the world -- is it sold in UK, Australia, NZ, Europe?). Worked fine for me. A ICOM speaker mike picked up at a hamfest works fine. I just need to get a 1/4 antenna for it and I'll be happy portable.

If only they'ed bring out a NARROW front end DUAL band rig. I can dream can't I!!

70. Newbie question: What is iambic?

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-15 21:20:53 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9303152123.AA05261@netmail.microsoft.com>
Source record: 283951

You remebered you english lessons!

For example, Iambic pentameter is:

didah didah didah didah didah

The stress is on the dah.

In a paddle keyer it means that if you depress both paddles together then you will get a sucession of didahs or dahdits (depending on whether the dit or dah paddle closes first) rather than a dit and a succession of dahs or a dah and sequence of dits. Why do it this way? It removes the highest frequency movement for sending morse otherwise you would have to do a lot more finger movement for letters like C.

To send a C: squeeze both paddles together; make sure the dah paddle (normally the thumb/left hand paddle) closes first; hold till you get the letter out.

didahdidah.

For a period just hold it closed a little longer:

didahdidahdidah.

Most keyers also have a meomory that will remeber that you hit one paddle whilst holding the other down and insert that element when the current element ends.

For example to send Q: hold down the dah paddle. part way though the second dah, tap the dit paddle (keep the dah paddle held down). This will send dahdahdidah.

The wait is over--the license is here, and now you may address me as N9SQE! I was actually expecting a longer wait, based on horror stories from others, but in my case the license arrived just under two months from the date of my examination (15 January 1993). I have passed General theory and 20 wpm code--now wish me luck in passing the Advanced and Extra theory! Sorry if I sound a little exuberant, but I am really quite happy about this.

78. Cleaning Air Variable Caps.

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-15 23:22:30 UTC
From: nat@kpc.com
Message-ID: <1993Mar15.232230.23383@kpc.com>
Source record: 283893

Hello,
I picked up some air variable caps at a flea market this weekend. The guy
I bought it from suggested I throw them into the dish washer first. I don't have
access to an ultrasound bath. Any ideas on cleaning and lubricating the bearings
would be very welcome. If I am inundated with some really innovative ideas I
will summarize and repost it.

One of the caps I picked up is a differential cap (2 sections of the same
size with the rotor being the common terminal to the 2 caps). Any idea why it is
called a differential cap? I was thiking of building a transmatch with it. The
circuit I was thiking of was the following

section 1 section 2 of diff cap

```
------| |--------------| |-----
|
|
transmitter inductor antenna
|
|
|
-----
---
-
```

Most of the commercially avaiable transmatches seem to have 3 degrees of
freedom, while the above circuit has only 2. I wrote out the impedence equation
and they look ugly. I was trying to see if I could get closed from solutions to
selecting the L and C given the antenna impedence is R + jX and the transmitter
expects the impedence to be A + j0. The impedence had 2nd and 3rd order terms for
the capacitance. Since the above circuit has only 2 degrees of freedom I think
I will be able match only a range of antenna impedences. I have to grind out the math
to figure out the limits. I guess the key point if that if I have a reasonalbly
well tuned antenna the above circuit will be able to provicd the required
transformation. So the question I pose is that is the above circuit reasonable or
am I way off base?
Should plunk down good money and buy a roller inductor or should I buy a
B&W air wound coil and tap it, or should create a tapped inductor around a ferrite
core (for HF bands what core material should be used)?

Thanks in advance.

79. TS-50 Impressions

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-15 23:33:52 UTC
From: fred-mckenzie@ksc.nasa.gov
Message-ID: <fred-mckenzie-150393183151@k4dii.ksc.nasa.gov>
Source record: 283895

I just purchased my TS-50 last Friday, and am still getting to know it. The more I learn, the more impressed I am with the technology involved.

First, I would not recommend it for the person who has room for a larger radio. It probably has nearly identical features to the Kenwood TS-450, for the most part, and the TS-690 has an even wider frequency coverage. It uses some of the controls for extra functions, rather than cluttering the front panel with additional knobs. I'm not sure if I'll ever be able to remember enough to operate it without the owner's manual at hand!

It seems that you hold the "f-lock" button for 2 seconds to get to the set-up menus. There are "A" and "B" menus, selected with the "A/B" VFO button. I forget how many parameters can be changed in the menus. It might be around 80 or so! Even the functions assigned to the 4 buttons on the face of the microphone, can be changed to whatever you might prefer.

One function I added to one of the microphone buttons, was the ability to read the 10 KHz and 1 KHz digits. Normally, you can only read frequency to the nearest 100 KHz on the main dial, compared to 10 KHz on the (modified) TS-430/440/450/et cetera. The fact that the radio uses 5 KHz steps is of little value, if you don't have the high accuracy (TCXO) option. Once I figured out how to set the frequency to exactly 20.000.000 MHz, I found the error with WWV to be less than a 5 Hz step, with the high accuracy option installed.

One area that may concern the SWL, is the low frequency limit of 500 kHz, compared to about 150 kHz of the TS-450/690. If you're interested in low frequency stuff, it isn't the radio for you. However, it seems to have slightly better broadcast band sensitivity than my TS-690.

I noticed that nearby stations above about 30 dB over S-9, sound distorted, even with the "AIP" feature turned on. (I also noticed that on my TS-690.) I've never noticed such overload on my older TS-120 or TS-430, so it appears to be a step backwards. However, it may be an unfair comparison if the newer radios are much more sensitive. If so, their true dynamic range may be the same, just shifted downward.

As of last Friday, the AT-50 automatic tuners had been shipped but not received, by any of the dealers who were at the Orlando Hamfest. I purchased my TS-50 from Amateur Electronic Supply in Orlando. I got the CW filter and high-accuracy options. However, none of the other options unique to the TS-50, were available yet. As of this weekend, spec sheets and price lists are available.

Carlton-

I heard the same report. So, this weekend at the Orlando Hamfest, I asked the AEA rep. about it.

AEA claims that the new unit, the PK-300, PK-400 or PK-600 (I forget), is a new model in the line, but doesn't replace the PK-232. (Amateur Electronic Supply has had it for several weeks.)

At the same time, there is an upgrade available if you have the MBX version of the PK-232, that includes Pactor.

A couple of years ago, my father (KA2KMO) and I built a tuner of this design. We made our own differential capacitor by taking two Nevada 250 pF units (available from Kilo-Tec in Arizona) and cannibalizing them. We also used a Nevada roller inductor. I chose to use a roller inductor because, being a purist, I like to have my SWR at exactly 1:1. This arrangement works very well and is a cinch to tune (2 hands, 2 knobs). The only disadvantage I see is that this circuit acts as a high pass filter, and thus provides no harmonic attenuation. I wonder if a differential inductor and a capacitor to ground would work . . .

The old Radio Shack phones were easily programmable to force transmission
and reception on any of the channels the phone is capable of using. I can't
rememer the correct way to do this but you need to first get ahold of a
service handset for the programming. Some of the radio Shack managers will
have the info to help you. I think the service manual tells how to do the
programming. The only trickk is the service handset. I can't remember how
to convert a regular handset for this use but it was really trivial I think
it was grounding pins 5 and 6 together. Don't do this on my word I am not
at all sure which pins need to be shorted together, but I do know that is all
that needs to be done. Good luck and happy hacking!

Yes!! I agree.

>How come when I go to an appliance dealer, usually, the salesman is eager
>to show me the latest whistles and bells on a washer, VCR, dryer, etc.
>Why? Because they work on COMMISION and/or they are well TRAINED.

>What a concept for the ham world .....

I think commissioned sales people would be a bad thing -- it's hard
to make them go away and let you make your own decisions.

Informed sales staff would be a very good thing.

A good reference model is REI. They're a mail order supplier of
camping climbing and backpacking goods. They have a few stores around
the country and the staff are very friendly, well informed and
helpful -- they are not on commission.

>My question: does anyone know how to clear ALL the memories? No jumper I could
>find inside the rig, and no "clear" button. The "manual" does not address this
>issue, much less many others.

You can't. (Short answer).

Long answer: If you reset the CPU, it will clear all thje memories. However,
on most older models this will also clear the firmware and you must reprogram
some basic stuff from scratch. However, resetting the CPU also requires
total disassembly, soldering, and voiding of one's warranty. There are two
non-labelled pads on the CPU board which, when shorted, will lobotomize
the radio upon power-up.

Short answer: you can't.

Shameless plug (no financial interest involved).

=THE= manual to get is Howard Bornstein's "Guide To The AR1000" available

88. Join a Internet->Packet Gate at Cal Tech

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 00:43:26 UTC
From: pjb@hss.caltech.edu
Message-ID: <1o37reINNa5t@gap.caltech.edu>
Source record: 283909
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

We have a copy of wg7j 1.08 NOS running on packet and the
internet at Cal Tech. This system has a 9600 baud packet radio on
70cm from which you an connect to a local bbs, a local node which can get
you out to other locations in southern california, and even las vegas
and phoenix (or further) via other mountatintop systems. There is also
conference or roundtable type system in the area where a half dozen
ito a dozen congregate every evening. A 2m, 9600 baud port is in the
works and should be completed shortly.

I am prepared to accept memberships in a "Caltech Packet Gateway
Group" (or whatever we decide to call our subgroup of the campus radio club)
from random FCC LICENSED individuals on the internet.

The Caltech Radio Club Packet Gateway Group, shall

* maintain and expand a packet/internet link at Cal Tech
in accordance with FCC rules and the interests of the developers.
* facilitate the expansion of packet facilities in California
* act as a collection of people knowledgable in high speed packet,
networking, and other technical types throughout the southern california area.
(hopefully this will also provide for some continuity in my absence)

Currently we have a 386/25, some radios, some hardline, and a
makeshift antenna. We need a decent 2m/440 antenna. Also, the equipment
must be remoted on a higher building where we will have line of sight
to much of la and orange counties.

In the long term, we would like to
R&D some high speed packet stuff and/or get space from coordination bodies
to get 56KB or higher speed packet going in california.

I honestly do not expect to be around much more than a year and a half,
however.

Some information may be found by anonymous ftp to w6ue.caltech.edu.

At this time, I am interested in getting a list of individuals
who are interested and would not mind joining a support group ($$) so that
we can improve the system. I and several others have contrbuted over $1000
of equipment in order to get started, and quite frankly feel the need to go
to a user-supported system.

Operators callsigns will be automatically transmitted when you
are using the system (just like your radio + tnc was on our tower). Proof
of license of technician (no-code ok) or better license will be required
before we will give out passwords to access the system. At first I would

like to limit membership to a dozen or two interested persons. The system can handle multiple logins, but I must emphasize that we just got the system functional a month ago and need to fund some improvements before feeling comfortable opening it up more.

Current FCC rules make accessing INTERNET from PACKET fairly unworkable. Also, on a 9600 baud radio channel you at most get 1200 baud or so of service (remember you share the channel with others). Thus, capacity is not up to the traffic volume found on internet. Also, this seems to me to be mainly a way of avoiding telephone use and/or paying access fees. I don't want to tie up busy radio channels because some one is to cheap to pay whatever netaccess costs these days.

reply to: pjb@hss.caltech.edu

I will see how many responses we get in a week or so, and decide then how we shall proceed.

73 de Paul KI6CQ
pjb@hss.caltech.edu

89. Monthly Review of Solar & Geophysical Activity for Feb 1993

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 00:44:12 UTC
From: oler@rho.uleth.CA
Message-ID: <9303160044.AA11382@rho.uleth.ca>

```
-- MONTHLY REVIEW OF SOLAR AND GEOPHYSICAL ACTIVITY --
Summary for February 1993

Report compiled by the
Solar Terrestrial Dispatch
P.O. Box 357
Stirling, Alberta
T0K 2E0, Canada

Data Provided In-Part Courtesy of the
Space Environment Services Center, NOAA
and the
NRC / Dominion Radio Astrophysical Observatory
Penticton, British Columbia, Canada

MONTHLY ACTIVITY SUMMARY FOR FEBRUARY 1993

We are now in month 78 of solar cycle 22 (as of February 1993). There
were 428 flares (optical and x-ray) in February. This is over 2.5 times as
many flares as were observed in January. This exceeds the total number of
flares observed since August 1992 when 487 flares were recorded. Of the 428
flares, two were ranked as major events and 16 were categorized as minor
M-class events.

A breakdown of the energetic events for the last four months follows
below, together with a summary of the percentage increase or decrease in the
number of energetic events amongst the four months. Negative percentages
represent decreases. For example, there were 159.4 % more energetic events
in February than in January, while January had 41.9 % fewer energetic events
than December 1992.

-------------------------------------------------------------
| | FEB '93 | JAN '93 | DEC '92 | NOV '92 |
| | --------|---------|---------|---------|
| Major | 2 | 0 | 0 | 1 |
| Minor M-class | 16 | 2 | 4 | 7 |
| Class C or smaller | 410 | 163 | 280 | 326 |
|--------------------|---------|---------|---------|---------|
| Total | 428 | 165 | 284 | 334 |
|--------------------|---------|---------|---------|---------|
| FEB |+159.4 % |+ 50.7 % |+ 28.1 % |
| Percentage ---------|---------|---------|
| JAN |- 41.9 % |- 50.6 % |
| Change ---------|---------|
| DEC |- 15.0 % |
-------------------------------------------------------------
```

The monthly sunspot number for February was 126.1 as computed by the SESC. The preliminary RI international sunspot number for February was 90.5. These values compare with the sunspot numbers recorded for November (SESC value of 124.3, RI value of 92.0) and December (SESC value of 127.4, RI value of 83.3) of 1992.

The monthly 10.7 cm solar radio flux for February was 142.6. This value also compares nicely with the mean flux values reported for November (145.2) and December (139.0) of 1992.

The largest flares of February were observed on 06 February and 17 February. The first attained a class M9.6/2B rating and was the result of a combination 3B flare in Region 7417 (then located at N15E20) and a 2B flare in Region 7419 (then located at N11E25). The flare was accompanied by a 660 sfu tenflare, but lacked both Types II and IV sweeps. By 21:00 UT, the post-xray signature of this event exhibited a fairly attractive series of sinusoidal oscillations approximately 15 minutes in duration each.

The major flare of 17 February was a class M5.8/SF event that peaked at 10:40 UT. This region was near the west limb (at S07W87) during this event which allowed detailed observations of loop and surge dynamics. There were no sweeps reported and the event lacked significant radio bursts.

The list of minor M-class or greater flares and associated radio emissions observed during February follows:

SUMMARY OF MAJOR ENERGETIC EVENTS

Date Begin Max End Xray Op Region Locn 2695 MHz 8800 MHz 15.4 GHz

21 Feb: 0024 0043 0102 M1.4 SF 7433 N13E75 23 18 15

The geomagnetic field in February was slightly more active than in January. The estimated planetary A-index for February was 15, compared with 13 in January. The average monthly estimated planetary A-index values have been within 2 points of 15 for the last five months (since October 1992, inclusive). There were two sudden magnetic impulses observed during the month. The first was observed at 03:02 UT on 17 February. The second was observed at 22:20 UT on 27 February. This latter disturbance was thought to have been due to either a well placed coronal hole or disappearing filament effects (or a combination thereof) and was not followed by very significant geomagnetic activity.

The most disturbed day of the month was 17 February. An initially quiet field became disturbed following the sudden magnetic impulse at 03:02 UT. Minor to major storming ensued at middle latitudes and major to severe storming was attained at high latitudes between 09:00 UT and 18:00 UT. The source of this activity was not clear, but could have been related to a filament which erupted off the disk on between 18:20 UT on 13 February and 17:57 UT on 14 February. The filament measured approximately 14 degrees in extent.

There were no satellite proton events during the month. However, by the end of the month, proton fluence at greater than 10 MeV was showing a definite upward trend, possibly related to a proton-producing region (Region 7440) that was within several days of the east limb.

* = Preliminary estimates, Unmarked = Final Values.

The lowest smoothed sunspot number for Cycle 21, RI = 12.3, occurred in September 1986. The sunspot maximum for this cycle (cycle 22) occurred in July 1989, with a peak smoothed sunspot number (RI) of 158.1.

Note: Prior to June 1991, the 10.7 cm solar radio flux measurements originated from the Algonquin Radio Observatory near Ottawa. From June 1991 onward, the flux has been (and will continue to be) measured from the Dominion Radio Astrophysical Observatory at Penticton, British Columbia, Canada.

DAILY VALUES OF SOLAR FLUX AT 2800 MHz (PENTICTON-DRAO) AT 2000 UT

SUMMARY OF AVERAGE SOLAR AND GEOPHYSICAL INDICES FOR FEBRUARY 1993

(Based on SGDB data released by the S.T.D.)

10.7 cm Solar Radio Flux: 142.59
Sunspot Number: 130.21
Boulder A-Index: 11.82
Planetary A-Index: 13.64

Background X-Ray Flux (1-8A): B5.64

Proton Fluence at > 1 MeV: 1.6311e+06
Total (non-averaged) Fluence at > 1 MeV: 4.4040e+07
Proton Fluence at > 10 MeV: 1.1544e+04
Total (non-averaged) Fluence at > 10 MeV: 3.1170e+05

Average Daily Deviation of the Boulder Magnetometer: 20.18 nT

Short Wave Fadouts (SWFs): 0.64
Total Number of SWFs during Interval: 18
SWF Durations: 10.07 minutes
Total Duration of SWFs during Interval: 282 minutes

Average Daily X-Ray Flux: C1.11
Average Neutron Counts: -0.04%
Average Daily PCA: -0.01 dB

90. More Newbie Stuff

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 01:43:45 UTC
From: dbraun@cad636.intel.com
Message-ID: <C3yKt0.AoM@inews.Intel.COM>
Source record: 283912

Hello again,

Thanks to this groups helpful people and FAQs, I fiound a copy of Super Morse, and last Saturday passed the 13 WPM test when I expected to only pass the 5 WPM! I also passed the general theory, so sooner or later my license will show up in the mail!

I was also at the Foothill swap earlier that day, and was inspired by all the stuff for sale.

So my questions are:

1: What's the best reference for exactly which parts of what bands each class of licensee my operate on, with what power and what emission types? I have seen this info scattered piecemeal through the study guides, etc., but never concisely presented in one place. If there are one or two books that have all the facts you really need to effectively operate, could you recommend them? (I guess would be the ARRL Operating Guide and their FCC Regs book)

2: Is there a good guide to old HF rigs? (Either online or in a book?) I'm interested on tube stuff.I saw a lot of Heathkot (HW-101, SB-XXX,) Drake, Yaesu, etc. stuff for sale, but it's not clear what the gems or dogs are. (Yes, it's obvious that a Drake TR-4(?) is better that a HW-101, but then it costs three times more.)

Thanks,

--

91. W9GR DSP Kit

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 01:45:06 UTC
From: ag821@yfn.ysu.edu
Message-ID: <C3yKv6.8v2@news.ysu.edu>
Source record: 283913

Just got my DSP kit in the mail Wed. Was going to put off
building it, but the big snow storm didn't allow me to get
away on my planned vacation.

I was real impressed with the quality of the board.. and the
parts. Everything on the parts list was there. The parts list
was very descriptive, listed all possible alternatives that
might be in the kit (like dif. labelings of caps and other parts).
NOw to some of you El. whizs this is no big deal. I am fairly new
at this stuff and getting better with each project, but still
don't know the 5 or so diff possible labelings for each cap
and IC.

The instructions say that the kit is not for beginners. I have been
a ham for about 2 years and have now background in electronics, except
what I had to memorize for my license. I have built a HW9, a Ramsey
2 meter kit, an Oak HIll QRP meter, a couple of keyers and an Argonaut
filter from schematic, and in my opinion this was the most enjoyable
kit (along with the Oak HIll) and best quality I have very had the
pleasure to build.

The directions were absolutely clear. There was no ambiguity at all.
The solder pads went thru the board, and the board was coated ot
prevent most bridges. Using the right soldering iron, the soldering
was great. I have never been so proud of a piece of equipment I
have built. I will proudly show both the component side and bottom
side. It looks better than any commercial jobs I have seen. TThis is
because of the board and the nice way it solders. (i recently used
a Radio Shack component board for a filter..and found that it really
didn't like being soldered allthat much).

I performed the "smoke test" and it tested fine. I put in the
chips and then took a break to go to town to get some lettering
to make the enclosure look better. I used RCA jacks to that I
could use the filter on more thatn one rig. When I hooked up the filter
and turned it one and did the simple vol adjust from my rig, it worked
fine the first time.

I have played with some of the functions and they all seem to work
great. the bands aren't that bad tonight, so will have to wait
and try it out some more on 40.

I sure wish that DAvid, W9GR would kit some more things...My only
complaint is that I am now having post kit building depression. I was
really ttaking my time, and it just went together too easily and
without any hassles

thanks David.

i won't repeat Michael's post, VE3WMB.

but he did bring up an interesting question. is the ARRL allowing Field Day on the WARC bands? i thought we had an agreement to stay off them critters for ALL major contests. am i ignorant and/or misinformed?

don't flame me, i'll be working QRP field day, but not on the WARC bands.

93. Foothill hamfest disappointing

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 02:13:16 UTC
From: randall@informix.com
Message-ID: <randall.732247996@seashore>
Source record: 283917

I want to say first that I enjoy hamfests very much, and that
I really appreciate the one they hold at Foothill College
here in the Bay Area every month in the Spring and Summer.
I'm sure that a lot of work goes into it, and I and many
other hams appreciate it. There are, however, serious
problems with the event that seem to get worse every year,
and I wonder if they are problems common to other hamfests.

The first problem, and this may be a problem with hamfests
in general, is that there are fewer and fewer "Joe Hams"
who are selling one or two items. Most of the sellers
are what I would call "Pros": they are either professional
retailers or professional hamfesters. These are the guys
with tables and tables of parts, test equipment, books,
etc. Some guys seem to enjoy collecting parts for a living
for sale at hamfests. I don't mind that too much, except
when there isn't enough room for "Joe". I remember buying
my first HF rig a few years ago- a Drake TR4- from a "Joe"
who was just selling a couple of items. There don't seem
to be too many of them anymore. Most of the used HF rigs I saw
were being sold in groups of 20 or more by Pros who had
them waaaaay overpriced.

This event has simply grown too large for the available space.
I was one of dozens of sellers who were turned away due
to lack of selling space, even though I arrived well before
the supposed 7:00am starting time. I found myself in the
middle of a massive traffic jam of sellers that blocked entrances
and access roads into the college. The only nearby parking
lot for buyers was filled to the brim before 7:00, and no one
was directing traffic, telling buyers and sellers where to
go, or even giving information over the radio. I started giving
people directions on where to park on a 2m repeater, so at least
I was trying to help. The event is in need of more room.
If a larger facility is not available, perhaps it could
be held more often, say every two weeks instead of monthly.
There is also a serious need for better coordination of traffic
and parking information.

Another thing ... is this a HAM flea market? You wouldn't know
it by the items being sold. It seems like there are more
and more old computers, old stereos, old test equipment, and
even garage sale things like LPs and lamp shades. If I want
to pick up my favorite Village People 8-track from the 70's, I
can go to Ronnie's Rare Records. And who is going to

buy old coax that looks like someone shredded it then put
it out in the sun for 40 years? Or how about homebrew
ladder line that someone's cat relieved itself on? Oh, and
if you want to pick up 50 old IBM-XT keyboards, you can
find them there too.

I would have KILLED just to see one nice, drifty old Heathkit
with solder all over it. Granted, there were a few, but
they were far-between.

There is one interesting thing I saw. A kid around 12 years old
was selling straight keys that he made himself with wood and
various metal parts. They looked well-made too. That to me
is the spirit of what ham radio is all about. I almost bought
one, too, but I had $2 left, and I wanted to enjoy "YMCA"
while driving home, so ....

Mike,

it'll cost you a heck of a lot more to get the 1957 Buick RoadMaster
to run to do steps 3 through 5..... ;-)

how old are you? anyone else on this net remember any autos made in
1957? i was walking myself until 1964, and that's the truth......

I am presently considering purchasing a Shinwa SH-405GII
Portable. This is a 99 Channel Programmable (Of Course, that's
Alotta Crystals) 450 - 470 Portable w/ LCD, scan, DTMF, etc.. It looks
like a nice unit.. I'm not sure what the price is, but I'd like
to get comments on the unit itself, and Shinwa quality in
general. I believe that it will also go down to HAM areas..

Anyhow.. just looking for comments / suggestions.

Source record: 283920

pst@cisco.com (Paul Traina) writes:

>I was down at HRO today, and I asked them point blank about this.
>Gee, verifying facts in USENET? What a concept.
>OK, you pinheads, here's the scoop from HRO:
>HRO does hire part-time staff for heavy days (i.e. Saturday). They
>are paid, albiet a very low wage (I would assume they are making
>minimum). They say they do it because they get exposure to new radios
>(play in the toy store), to meet the people they hear on the air, and
>they get the standard fringe benefits that a full-time HRO employee
>gets.

My original posting was based on what Tom told me. "My staff
on weekends are volunteers." Those were his exact words. He
made a special point of walking right up to me and saying it.
He reacted to my previous posting, which simply theorized
that HRO employees make very low wages. Well, if what
you're saying is true, then what I said was true too ...
so what was Tom's problem?

>Next time, at least have the decency to do some research before
>flaming off.

If what you are saying is true, then HRO lied to me ... not only
lied, but marched right up to me and lied.

Well, this whole thing has been extremely weird, and I can
assure you that this is the last time I will post anything
about HRO, or walk into that store.

I need schematics for a Heathkit SB-610 monitor scope. I got one
cheap that almost works. I think I see the problem, but I can't
be real sure without the specs. The manual would be nice too, but
I can do without it. Can anyone out there please help?

Thanks & 73 de KQ4OQ

101. Want Dual-Band mobile comparisons

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 03:57:31 UTC
From: clemon@lemsys.UUCP
Message-ID: <rHcCs*Su1@lemsys.UUCP>
Source record: 283941

I threw this out on the net before and only got one email response.
It's possible that it got eaten somewhere or that no one has any opinions
(after what I've seen in the last 6 months, I don't think that's the case
:-). Also, since the Alinco DR-600 has been around for a little while now,
it will probably be easier to get an answer :

I'm looking for comparisons, or any observations, between/about the
following rigs :

Kenwood TM-741A (let's say the TM-732 as well)
Standard C5608D
Alinco DR-600T
and possibly ICOM IC-2410H

I would like to hear any comments you have after having owned or
tried one of these rigs. If you own one, what have you noticed that you
really like or dislike, that isn't the kind of information that you find in
a brochure (ie. you really hate the way that radio X stops scanning on a
channel with a carrier but incorrect PL, or the way that you cannot have
CTCSS different from the PL encode when crossbanding etc...etc...).

I am especially interested in the performance of the radios. What
is a rig with loads of bells and whistles if the radio sucks, right? This
is going to be a base station radio at first, so intermod runs wild and
free in my antenna :-). How is the intermod in these rigs compared to
previous rigs. I don't think comparison to a single band rig would be
fair, however. I think that I will be putting a bandpass filter on the
2-meter portion of the antenna anyways, but I'm still interested in hearing
about these rigs running stock. Obviously, the rig would have to have
separate VHF/UHF antenna connections to make this easy since I have a
dual-band base antenna and I don't feel like buying 2 duplexers just to
insert a filter! Mechanical construction is also somewhat of a factor.

Please, any comments you can offer on these radios would be greatly
appreciated. If you post, it might be a good idea for cc: in email as
well, since I might not get to read all of the news or something might
happen to my newsfeed (a little flaky getting a good connection lately).

Thank you in advance de

Try ftp.geo.brown.edu. Directory is /pub/hamradio/rigmods/yaseu, if memory serves (yes, yaseu, not yaesu like it says on the actual rig, nobody's perfect :). Files are ft470*.mod

I have done the UHF expanded receive and have used the hyperscan. Both are easy and painless, although I've never heard a peep above 470 or below 420 on the UHF receive (of course I look at my friend with his IC-W2A and his intermod problems and I don't complain too loudly :).

Andy Collins, KC6YEY
acollins@uclink.berkeley.edu

PS: The thing is a SparcStation *10*. Real fast. Nice net connection too. Wish they had some more junk to play with though...

103. DIR/REG

Message-ID: <1993Mar15.233521.22235@yang.earlham.edu>
Source record: 283927

I have a pair of older Motorola MT-500 "Handie-Talkie" (slick name) portables. They have this old-style motorola screw-in antenna connection. The problem is, the threads start much deeper down the recess than the new ones, so stubby UHF antennas made for newer units don't fit in them.

All the other connections are bizarrely nonstandard too. The earpiece and external antenna jacks are 2.5 mm phono (identical so it's *really* easy to plug 'em in wrong). The external mike/speaker unit has a questionably sound mechanical connection dealy going where you hook a lip over a notch, and screw down another part.

So I'm looking for adapter or compatible part availability. I'v never dealt with these crystal tuned Motorola thingys before, so I don't know Motorola's number or anything.

From: robert@lunatix.uucp
Message-ID: <1993Mar16.045858.13775@lunatix.uucp>
Source record: 283925

Can anybody out there point me to a source for a schematic?
For those who may not be familiar, CHU is the Canadian time
standard. Its transmittted on 3330 kHz, 7335 kHz, and 14670 kHz.
it transmitted in A3H mode (a form of single sideband, I am told)
I am not a ham, but can handle an iron OK, so a pointer to a
suitable Reciever IC would be a big help as well. I hope to
extract time info from the FSK data transmissions.

Thanks,
Robert Sexton.

107. Re: What is RST?

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 07:05:07 UTC
From: ajk@cssec4.unt.dec.com
Message-ID: <1993Mar16.070507.7782@rdg.dec.com>
Source record: 283924

Here the answer:

RST is for amateur radio what SINPO, SINFO or SIO is to SWL.
It is a code to measure reception quality.

S = signal strength
T = tone quality

RST is used for CW, morse code transmissions; for normal speech only RS
(R and S, no T) are used.

R code goes from 5 thru 1, codes for S and T go from 9 thru 1, with highest
number being best, lowest worst.

>it operates all bands, all modes.

Sorry, Gary, but 10 MHz contacts don't count, since this is a
secondary allocation. (allocated to the fixed service on a
primary basis outside the United States an Possessions.)

But, the 18 and 24 MHz bands are exclusive amateur allocations,
so operation on these bands is encouraged.

Last year there were a number of microwave contacts in the
Northeast, even on 5.7 GHz and 10 GHz, despite difficulties with
trees.

Source record: 283933

I have experimented out of band many times, legally.

With a modern synthesised transceiver set for full range transmit,
you have an excellent synth signal generator with more comprehensive
modulation facilities than the most expensive lab jobs. You can either
put it into transverter mode and use the transverter output socket, or
else use a high power attenuator on the main output and wind down the
output power. A wide range switched attenuator is a worthwhile addition.
I've used this to develop crystal filters at home, using a spare Rx
as detector. Freq response, insertion loss, and return loss (or VSWR)
can all be measured with good accuracy. Although I have a high quality
non-synthesised signal generator, it is not sufficiently stable, nor can
its frequency be set finely enough.

OK, I'm in a minority. There are plenty of people with store-bought
radios, antennae and towers. There are plenty of people who experiment
and build antennae and their accoutrements, but the number who
experiment with the actual radios seems to have been shrinking for many
years. I seem to be treated as a sort of endangered (and protected)
species by the locals :-)

Just because someone wants to change a transmitter's frequency
coverage is not a certain indication that he is about to join the
"freebanders" or order pizza via police repeaters, although he could be!
Automatic flaming could hit the inocent. Aim carefully at a real
guilty party, THEN pull the trigger all the way.

Cheers
David GM4ZNX

I won't touch the question, but Field Day is not a contest. It's an
emergency communications drill. So it's just as important to get
experience setting up for the WARC bands as for any other. Field Day
also operates the satellites, which are likewise contest-free. Viewed as
emergency practice, you can see why all bands/modes are used.

A QUESTION, from a distant land...

My UK licence requires me to keep equipment capable of verifying that my transmitters do not radiate any unwanted signals, and requires me to demonstrate my ability to use this test equipment should our equivalent of the FCC visit and ask. I expect that US amateurs are under some equivalent obligation to ensure their transmitters are clean.

I get the impression that your new law is so generally worded that it might outlaw even a simple passive wavemeter that could tune into the 800 MHz range, and compel them to have "microprocessor chips" to prevent them being tuned into this region. (without any statement about how they think mcroprocessors could do this!)

If this is so, how are you supposed to resolve this?

I wonder if the law is so generally worded that it makes the cellphones themselves illegal, this could cause great fun.

Will amateurs be granted a general waiver for equipment used to ensure compliance with transmitter cleanliness requirements ? or can those requirements themselves be waived?

As a matter of interest how much is a 100W 250 MHz slug? I checked in the UK and it is the sterling equivalent of $88, after sales tax at 17.5%.

The cavity is also most expensive. If you can use a 100 uA meter, what is the maximum reading? I have a 500W 50-125 MHz slug (ok on 144 MHz) and I need to measure a kilowatt.

On the other hand, if I spend $15,000 on a truck, I'm damn sure going to do anything I want to it, including drilling holes. Forking over that much money *better* earn me the right to drill holes. I bet you keep plastic slipcovers on the upholstery too.

120. qsl and 2X

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 13:59:27 UTC
From: barp@ghost.dsi.unimi.it
Message-ID: <1993Mar16.135927.8444@ghost.dsi.unimi.it>
Source record: 283940

I'm IK2QCC Andrea Barp Milano Italy.

Dx'ing is my preferite activity in Ham-Radio, and connect new Countries
is what I try to do on the bands.

But when arrives the QSLs confirming the contacts some troubles raises.
More or less 40% of cards I received haven't under mode of qsos the "2X".

More or less all diploms exept DXCC need that 2x MODE.
For example 40% of USA qsls hasn' 2X ssb or 2X CW and so i can use these
cards only for submitting a dxcc request, but how many times I've to
confirm a US State to submit a WAS request??

Anyway all those qsos were in two-way mode and so why not confirm
that? I never did a cross mode qso but from my qsl cards seems that
60% of mines was.

So for me is basically important to operate correclty on the bands,
but is fondmental that that precision will be put also in writing cards.

For example I've a nice collection of cards with a pre stamped array
with 2X MODE column, but with a computer label on it saying only for

example: IK2QCC 12.00 14 SSB 59. And the 2X?

So if we all try to pay a little more attention in all the actions related
to our activity I think that this will be appreciated also from
our correspondents.

Or I'm wrong?

73's to all and doog DX'ing to everybody.

Haven't experienced it my self, however I would look to the transverter or
transverter connection for the problem! Remember you said the key words of
HOME BREW! I use the provided back plug for the TS 430 transverter input.
Remember the std plug has a mechanical device that switches the tranciever
into none high output RF. Is this a problem with out Transverter connected?
Have you tried a Microwave Module unit also to check(commercial)? W1DGA

122. [Second try] Want info on RS232 commands for ICOM radios

The Heath Company is alive and well, but is specializing in educational
items. I just bought a copy of a manual for a computer kit that was sold
in the 70's. Their number is (616) 925-6000. (I am not affiliated with
Heath - built a lot of their ham gear, though!)

>Seems like the 2 meter version should also work on 432 MHz. (3/4 wave
>is an odd multiple of 1/4 wave.) Then you could use the same coax for
>both bands, with an antenna switch up on the tower.

Yeah, I tried that, but for satellite you want duplex so I got a set
of the 70 cm transformers for the other line. I used to have a box
at the tower top containing several Transco relays in a matrix and a
couple of preamps, but CATV cable is too cheap (I got a free spool) to
bother with the hassle of a bunch of very expensive relays at tower top.
Now I have two transmit lines of CATV coax, and two receive lines of
9913 on the tower for 145 and 435 MHz. Only two TR relays are required
at the power level I'm using. If I were running high power, I'd need two
sequenced relays per band. For 1269 MHz I remote mount the transverter and
amp in a box on the tower and run 9913 down to the two meter IF rig.
Even CATV line has too much loss at 1269 MHz. I run power and control
cables through EMT conduits to the tower top box.

Jay, you might have seen less difference if the outside antenna had fallen off and the inside box had stayed in place. Somehow it doesn't seem worth the bother of trying to glue the devil back on, though, to complete the experiment and compare notes with Gary....

My 4x4 cost me over $50,000 at the then exchange rate (things are about double US prices, here) But I drilled a hole ! Sandpiper make a neat 2m/70cm antenna that looks like a slightly larger cellphone antenna, and sell a real cellphone antenna to screw on when you sell the vehicle. It's mounted near the front, driver's side of the roof so I can reach out to fold it over for multi-storey car parks. It draws no attention, and thieves have learned that stolen cellphones have no resale value - so they are not attracted by anything that looks like one

The HW101 is a fine rig.... I wouldnt blow off repairing
one because it lacks the hi-zoot dual microprocessor,
winky-blinky lites, multi-memory features of the
newest KenIcoSu radios.

The real beauty of the Heath gear is that it CAN
be fixed by mere mortals! Grab the manual and
dig in!

This does not sound good. Sensitivity has never been a problem
for receiver design for decades; signal overload has. Do you
have equipment to make a more objective comparison between your
TS-430 and this TS-50?

128. GMRS Frequencies - whats the scoop?

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 15:32:53 UTC
From: isenhour@lambic.fnal.GOV
Message-ID: <00969966.6F573AE0.6170@lambic.fnal.gov>
Source record: 283943

I was looking at a DAK catalog recently and they were selling a radio that transmitted on either 462.575 or 462.625. It was described as "GMRS" and supposedly needs some kinda license (FCC application included with purchase). I was wondering if anyone could tell me a little about this?

. What license is needed?

. Are there any frequencies besides the ones above?

. What does GMRS stand for?

. The info in the catalog suggested that this would be a great 'family' radio (and that only one license is needed), but I was listening last night and it sounded like it was being used by some security guards at a business, this seems kind of conflicting.

. What kind of transmitting power is allowed?

. Would this be worth investigating while I study for my ticket?

Thanks!

John

>
>fred-mckenzie@ksc.nasa.gov

It's called the PK-900, and it's designed to "fill the gap" between the PK-232 and the DSP-?232.

The obvious difference is the LCD display on the 900 vs. the 232's LEDs. Also, the 900 can run both it's ports simultaneously, whereas the 232 can only run one at a time. There are other differences that I can't recall.

I seriously considered buying one this past weekend, but I really didn't feel I needed what it offered, so I bought the 232 (and saved $180 ;) In the two days of playing with the 232, I've had nothing but fun.

If you like (and if I still have it), I could route you/post a synopsis of what I got in the mail about it (feature breakdown, unit comparisons, etc).

True, you need the 232 MBX version to use the Pactor upgrade, which AEA is supposedly shipping. I think the cost is around $75, which I hope to be spending soon.

Note: I have no ties with AEA. I just like their data controllers!

For shame Chuck, Field Day isn't a *contest*, it's an emergency preparedness drill. At least that's the ARRL official line, so it operates all bands, all modes.

|1: What's the best reference for exactly which parts of what bands each
|class of licensee my operate on, with what power and what emission types?
|I have seen this info scattered piecemeal through the study guides, etc.,
|but never concisely presented in one place.

The ARRL Rule Book has a chapter on this. It describes each band and describes in detail any restrictions, the possibly conflicting uses and privileges assigned on the band to other services and/or in other countries, and best of all details the band plan, by which custom, convention and agreement assign uses to various pieces of each band (though I think they refer you to the Repeater Directory for details of the VHF/UHF channel assignments).

| If there are one or two
|books that have all the facts you really need to effectively operate, could
|you recommend them? (I guess would be the ARRL Operating Guide and
|their FCC Regs book)

Exactly right. Everyone should have the rule book (or at least a copy of Part 97, which is an appendix of the rule book); and I have previously recommended the ARRL Operating Manual as a source of how-to-get-started information on just about every area of interest in ham radio as well as tons of useful information in its reference chapter.

This is approximately true. As frequency goes up, a given line spacing
will result in greater and greater radiation because the spacing becomes
large enough to affect phasing of the waves. At HF, any reasonable open
wire line will maintain proper phase relationships for cancellation of
the far field, but at VHF and especially at UHF, wide spaced line radiates.

>called a differential cap?
> [...]

There are two different kinds of variable caps that fit your description.
A differential cap is arranged so that as the capacitance of one section
increases, the other decreases. A regular "split-stator" cap has
both sections increasing in tandem.

Differential caps are used in odd situations like temperature
compensation (two fixed caps with different temperature coefficients
are attached to the stators) and some weird network circuits.
Split-stator caps are used anytime you want two capacitors that
track each other, or to create a variable cap with no wiper
(leave the rotor unconnected, hook things up to the two stators,
and maximum C will be 1/2 that of either section alone).

Try contacting your local FARM supply store... They carry Electric fence wire that is GREAT for long-wire antennae, Rhombics, etc.

It usually comes on 1/4, 1/2, and 1 mile spools. This stuff used to be copper-weld, but most of the new stuff is galvanized. The Ohmic losses will be slightly greater than copper-weld, but is still works quite well.

> Well, last night we had activated A.R.E.S. and Skywarn here in RI.

In Northern Virginia, Skywarn was up continuously as were the Emergency HF nets and several VHF operations. I spent all day Saturday at the Red Cross which was providing emergency 4WD transportation, primarily for medical personnel to get to work. However we also did end up transporting two medical cases to the hospital because the County emergency med was over capacity. 2M was used to provide links to the 4WD vehicles (either driven by hams or having a ham run shotgun) to provide dispatch, have directional assistance, and to phone the people back we were providing transport to let them know we had arrived in several instances. The other purpose is to keep tabs on the vehicles in case they ended up needing assistance.

138. HT antenna gain: relative to what??

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 17:16:17 UTC
From: "kevin.jessup" <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1993Mar16.171617.21110@mixcom.com>
Source record: 283965

I've got a question regarding published specs of antenna gain in manufacturer's catalogs of HT antennas: rubber ducks, telescopics, whips and the like.

A gain figure is usually stated. Something like, "This antenna will give you 3dB gain over your stock antenna." How in the heck do THEY know how good my stock antenna is? How did they come up with these 3 (and up to 6!) dB gain figures for their products?

6 dB gain relative to what? A 50 ohm resistor attached to my HT's BNC connector?

If two manufacturers are selling a 2 meter 1/2 wave whip, can I assume BOTH will be absolutley identical? I would certainly hope so.

Thanks for the info. Still new at this. Got my license on Saturday!

And on another subject...are any hams out there doing any spread spectrum work? It sounds very interesting. Also, wasn't ARRL going to come out with a spread spectrum handbook or something? AES here in Milwaukee says it is not yet available.

How do you like that? From a newbie antenna question to spread spectrum technology all in about 25 lines!! ;-)

I have a really fine dxing setup for sale: a Kenwood R5000 with a Kenwood SM220 panadaptor/station monitor. Basically the panadaptor allows you to visually examine +/- 50Khz worth of spectrum around where you are tuned. This allows you to see the nearby signals you are missing.

The R5000 is a very nice specimen and for those unfamiliar with it, one of the finest shortwave receivers you can buy. The audio is far superior to the NRD 535/525 radios that I own.

You can get this nice DX setup for $1000 and I guarantee it to be in good working order etc.

142. Repeater in simplex band ??

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-16 18:06:38 UTC
From: joes@hpwala.wal.hp.com
Message-ID: <4273@hpwala.wal.hp.com>
Source record: 283979

I recently began hearing a repeater in the simplex section of the 2M band (144.560 MHz). It is clearly a repeater, with autopatch, and I question the legality of this. 144.560 is the output frequency; I haven't found the input, and may not if the signals are too weak.

Does anyone have an opinion on this? Is it legal to use a simplex frequency as a repeater output? The person does identify his call, but he can't hear me since I don't know the input frequency.

"Honey - I Shrunk the Rig"
by Bob Gobrick WA6ERB

No this is not an article about Kenwood shrinking their new TS-50 HF rig into a "CB" sized package, but the "shrinking" of the low power level on the TS-50 from 10 watts to 5 watts output in order to "officially" comply with the nationally recognized QRP power level for contest operation.

Prepare yourself before you remove any covers from the TS-50 - this is no Hallicrafters (feel a little dated) with 6L6's glowing in the inside. All components are surface mounted and to conserve space surface mounted subassemblies stand up at right angles all over the place. No place to work with that stubby tipped Weller soldering gun. But have no fear, this QRP mod is simple - you just need a screwdriver with a blade the size of a toothpick.

If you check the schematics you will see on the TX/RX board two potentiometers to set the Low 10 watt (pot VR15) and Medium 50 watt (pot VR16) power levels. The high power level is fixed at 100 watts by resistor R214. Our goal is to get to VR15 and set it for a 5 watt output.

First remove the top cover, set aside speaker and remove the latched speaker bracket (gives you better operating room). Locate two teeny-weeny pots next to IF filter module in the middle of the TX/RX board. The pot closest to the front panel is VR15 (low power adjust) and the one closest to the back of the rig is VR16 (medium power adjust) - the pots are somewhat marked on the PC board. Hook up a QRP wattmeter, dummy load and power and while in the low power mode adjust the pot (I used a flat blade calibration tool I had around) for 5 watts. That's it. You may notice that you can crank the pot all the way down to 0 watts so set where you want. I suspect the medium power adjustment with VR16 can also go to zero so maybe you can go QRPp by setting the low power pot for 999 mw and the medium power pot for 5 watt.

PS: Kenwood Service cautioned that their automatic antenna tuner requires 10 watts to actuate so this adjustment may affect that operation. You may want to check if Kenwood actuates the low power mode when the antenna Tune button is pressed. Also don't expect to run this rig off of a small solar cell for field day - the unit and all of it's surface mounted components draws a bit of power - enough for the internal fan to come on even in the QRP low power mode.

Source record: 283964

Actually, unless something has changed, the 30 meter band is still
"off limits" to Field Day operation. All other amateur bands and
modes may be used for valid FD QSOs. It is correct to say that
Field Day is technically not a contest since no awards are given,
and no winners are declared.

> Last January I visited my old club back home, and they were planning a "J-pole
> Party" at a future meeting. They build them with 1/2" copper tubing so they
> are pretty sturdy.
>
Around here, J-POLES are very popular, particularly the 1/2" copper tubing
type. Several friends made them, and had very good luck with them. I first
tried to make the 300 ohm twin-lead variety, but got very poor results. I
have now made about 4 of these, and the best was only marginally better than
a rubber duck, if it all. I then (I don't like doing what everyone else does)
tried making one out of brazing rods, and this one actually worked
fairly well, except that the rods were so flexible that the spacing between
the 1/4 wl and 1/2 wl sections changed as it flexed in the wind. I then
used strips of plexiglas between these 2 sections for stabilization, which
helped a lot, but the 1/2 wl section was still so flexible that when a
bird would land on it it would bend. Finally, I resorted to the 1/2"
tubing variety, and it worked the first time, and has worked perfectly
ever since. I would now like to make another, except I have lost the
dimensions. I guess I'll have to bring down the original, and measure it.
If I remember, though, the long section is approximately 58", and the
short section about 18.5-19", and there is about 3" {I think that this
is a center to center measurement, } spacing between
them. The sections are connected with a "T" and 90 deg elbow. Any left over
tubing can be added to the bottom of the "T" as a mast connection, and can be
grounded. The COAX connection is approximately 3" up from the bottom, but
can be much more if the dimensions are different. I previously asked
here whether anyone knew how to scale the dimensions for various sized
tubing. An old timer told me to use the chart in the handbook which
relates center to center spacing to characteristic impedance, and find
where the curve crosses 300 ohms. This gives the 3" spacing for 1/2"
tubing, and seemed to work with the brazing rod antenna I made, and obviously
is consistent with the twin-lead variety, but why 300 ohms? As for the
other dimensions, the lengths seem to approach 1/4 wl and 1/2 wl with
the larger tubing, and are significantly shorter with the smaller diameters.
?Is this related to the velocity factors in the matching section?

Anyway, in addition to working at 2-meters, this J-POLE works very well in
the 70 cm band. I have been trying to make a 2-meter beam out of random
materials I have available, and have not been having much luck. A friend

suggested that since I had been so sucessful with the J-POLE, that I just take the J-pole and add a few additional elements as reflector and directors! Has anyone tried this? Does it make sense to make these additional elements just 1/2 wl, and locate them opposite the top open section of the antenna, or would it be better to make them the full 3/4 wl, or something else?

BTW, the brazing rod antenna was made by drilling 2 holes the size of the brazing rods in a 3/8" rod, spaced somewhere around 3/4" to 5/4", depending on the diameter of the brazing rods. The rods were secured by set screws in tapped holes drilled in from the ends of the 3/8" rod. The assembly was strengthened with plexiglas and attached to a 1" wooden dowel that was cut in half lengthwise for about the top 10"'s of it's length. Works pretty well for a tempory antenna, but isn't strong enough for premanent installation. Perhaps if mounted inside PVC tubing?

For balanced antennas, I like the old Harvey Wells Z=match circuit
that only had two knobs for tuning capacitors and no need for
a variable or switched inductor.

> Should plunk down good money and buy a roller inductor or should I buy a
>B&W air wound coil and tap it, or should create a tapped inductor around a ferrite
>core (for HF bands what core material should be used)?

> Thanks in advance.
> Nat.
You can get some nice roller or tapped inductors at most large hamfests
rather cheap. A roller inductor does require a turns counting dial which
is often more exepnseive for a good one than the inductor. You also need
a chart or a very good memory.

Scrub dirty air vaiables of any size with a tooth brush and tooth paste.
Smaller ones with q-tip and alcohol or solvent. Be sure to use a good
TV tuner lubricant/cleaner on the bearings so they make good electrical
contact as well as any contact fingers. K9ALD

The inductor needs to be variable too. Also a true differential capacitor
has the two halves in opposite phase -- that is, when one section is at
max capacitance, the other is at min. This is also what you need to make
the above circuit work.

Source record: 283976

In an earlier posting I made an incorrect statement:

> Two pieces of coax connected as you describe have twice the length of
>(lossy) center conductor and twice the impedance of a single piece,
>resulting in very nearly the same loss as a single piece of coax. At high
>UHF or microwave frequencies, the dielectric loss will become a factor and
>the two pieces of coax will be worse than a single one.

The dielectric loss (apparent at high UHF or microwave frequencies) would
be the same in both cases.

In the two-coax case, each line has 1/sqrt(2) the voltage that's applied in
the single-coax case. The dielectric loss per line is proportional to V^2,
so each line in the two-line case has 1/2 the loss of the line in the
single-line case, resulting in the same total loss.

Thanks to tomb@lsid.hp.COM for bringing this error to my attention.

I'm glad somebody's reading this stuff!

: >a separate radio.) Also, all of the HT's I've seen at least appear to be
: >more ruggedly constructed than _any_ scanner I've ever seen.
:
: Outbound CTCSS is a help, but it's not a full solution. Intermod can
: prevent the decoding of the CTCSS and/or it can still interfere with
: the desired signal adding heterodyne like squalling and sometimes direct
: mixes in your receiver with the desired signal, causing audibility of
: undesired voices and paging tones directly on channel.

I agree that CTCSS is by no means a full solution. It does nothing to improve reception of wanted signals, but it sure does cut down on unwanted signals. And since the repeaters that I listen to, at the times I listen to them, are quiet maybe 95% of the time, CTCSS is "sufficient", at least for the present. (Getting the commercial (ab)users that operate pagers, et al, ad nauseum, to adhere to good engineering standards would help more. Around here, the "annual inspections" of mountain top repeaters generally find the "amateur" ones passing with flying colors, but the "commercial" folks getting dinged for all sorts of infractions, especially lack of isolators.)

:Strong out of band
: signals can also do direct desense on your receiver, preventing it from
: copying the desired signal at all. This is a serious deficit of wideband HTs.
: Radio Shack, of all people, did it right with their HT. It's narrow
: frontend is nearly immune to these problems. Now if they only made
: a dualbander with similar properties. The only radio that comes
: close is the Icom 32AT. In the commercial two way field, both Motorola
: and GE HTs are bullet proof. Not only do they use helical front end
: filtering, but they are mechanically rugged as well.

I've not had much experience with the commercial HT's, but the commercial mobile radios make excellent repeaters when converted, not in the least due to the narrow front ends.

:All they lack to
: be ideal ham radios is to be tuneable across the band.

Uh, which do you want: super narrow front end, or tuneable? You can't have both in the size and weight of a reasonable HT.

:If you only
: need a few frequencies, they're ideal as is. My ideal radio would
: be as simple to use as an IC2AT with the electrical and mechanical
: ruggedness of a GE Mastr series HT. I don't want scanning or memories

The scanning can come in handy when in a new area for which you don't have a reliable repeater directory. I've done this: scan the 2M band looking for repeaters, or scan a series of repeaters looking for interesting ones, upon arrival in a new area.

As for the memories, consider the Zia link: 11 linked repeaters in three states using a total of 9 different frequencies. I don't know about you, but I'm not into trying to memories that many frequencies, or trying to punch them in while driving. (Due to financial considerations, my HT has to do double duty as a mobile rig, and it gives satisfactory performance.)

Also, I travel frequently in my job (usually by commercial airlines) to the mostly the same set of cities. Trying to remember sets of frequencies like that becomes a bit difficult. Easier to remember that memories 0 to 10 are home, 11 to 15 are San Jose, 16 to 20 are Albuquerque. (Especially when the same frequency repeaters need different CTCSS tones in different cities.)

: or the ability to emulate a Gameboy.

I have no need of it emulating a Gameboy, either! ;-) ;-) ;-)

: I just want a radio that works
: under extreme conditions. A radio should work in high RF fields,

I don't know about you, but I don't often hike around the "tower forest" of TV transmitters, nor do I make it a habit of camping directly infront of air traffic control radar antennas. ;-) I'm willing to put up with a little interference when I'm within 100 feet of a 50KW broadcast station, as for one thing, it lets me know that maybe I should keep on going! ;-) ;-)

: and
: it should easily survive a 6 foot drop on concrete.

I'll agree with that. (BTW, my DJ-F1T survived a 4 foot drop minutes ago.)

: Anything less is
: unacceptable.
:
: Gary

I'd love to have a ham-band-only mobile rig, and a mobile scanner, and a separate NOAA monitor, etc., in my truck, if money permitted. But when I have to carry equipment when I'm on foot (including through airports), I want as little wieght as possible consistant with being reasonably rugged, and still give me the frequencies that I need/want.

Since the government wants to leave me so little of the money I'm earning, I basically had to settle for a single radio for both HT and mobile work. I've found that with the addition of the CTCSS decoder board, the DJ-F1T gives me acceptable perfromance under the vast majority of situations.

Having never met you in person, Gary, may I ask if you are similar in build to Arnold Schwarzeneger (sp?)? If so, then I can see how you might not mind carrying several radios around. I, on the other hand, am lucky to be able to carry around a single radio, considering my physical handicap.

Just my $.02:

My XYL and I both own DJ-580's and love them. Jay did a great job on the manual (his final version is the one to get). Nothing will help you if you don't memorize what the keypad label abbreviations mean. After that, it is a piece of cake (for instance I like to switch scan modes according to my current needs i.e. am I waiting for someone and just checking out the action (TimeScan) or do I want to hear all of a conversation before moving on (BusyScan) etc. - just had to learn the labels and know where the function button is located).

I haven't run my car or truck over mine, but both of us have had drops (public service work gets that way sometimes). And we are real hard on BNC connectors since we switch antennas frequently. I've certainly got no complaints: and several friends tried out one of ours and bought one, so it looks like they sell themselves if someone has a chance to use one.

I try to purchase new equipment on the merits of the product and the price/performance ratio. The Kenwood came close, but the Alinco won for us in this case. IMHO.

>I recently began hearing a repeater in the simplex section of the 2M band
>(144.560 MHz).

The repeater bands on 2 are from 144.5-145.5 and 146-148. This machine may not be operating in accordance with band plans for your area (I don't know of any plans for the 144.5-145.5 segment that have outputs on the low side), but it's in the repeater band. I'd try 145.16 as the input (+600 KHz), and then punt. You could always look up his call in the callbook, and then call him up...

:
: Seth KC2WE

Arizona has such a law (per the letter of the law, every ITEM must be priced, but per enforcement, a tag on the self is sufficient, due to the bar-coding [UPC] arrangements).

The Phoenix HRO _DOES_ abide by the (enforced version) of the law, i.e., they have tags on/below/beside every radio, and on every "out front" "small" item. (The behind-the-counter items [for instance, speaker mikes, mike connectors, rubber ducky antennas, etc] are excempt from both the law and the local HRO practice.)

By the way, I had been in there a couple of times several years ago, and they weren't obeying the law back then, but have been since before I got my ticket. In talking to some friends, their tagging everything has made them much more popular with the local ham community.

Randall,
I've been attending the Foothill swap meet for about 13 years...the first one was a few cars in the parking lot with "stuff" in their trunk. Believe me, what you just experienced is quite an improvement!

Try to keep in mind that hams have VERY diverse interests...some will like DX, others digital modes, others EME. The few times my XYL attended she really got a kick out of the lady selling jewlery made out of IC's! The main reason "joe" doesn't sell out there any more is (1) its too expensive, and (2) he doesn't want to get up at 4 AM to guarantee he'll get a spot. I was one of those that would go to rid myself of excess ham stuff, but for the reasons outlined above I only do so once a year sometime in the middle of the season.

I'm originally from "back east", and frequented most of the BIG hamfests out there. Other than Dayton (go if you ever get a chance!), Foothill is one of the best swap meets I've ever been to. I haven't tried Livermore yet by the way. Also, I live in Santa Rosa...2 hours north... and find the drive worth it.

I say:

In the past there have been numerous postings from experienced restorers which described washing the equipment with soap and water (dishwasher or manual). I have not yet had a chance to try this on a piece of electronic gear, although I did do this recently with my wife's upright vacuum cleaner. The unit was FULL of dirt in the motor housing, and under tap water it released fistfuls of dirt, hair, fibers. I held it under running water for a good 15 minutes until the water started coming out clear! No soap was used. I let the unit dry for several days, then reassembled and did the smoke test. It ran like a champ, didn't overheat as before, and gave good suction. I felt great, gave kudos to those guys who turned me on to this idea, and the XYL was off my back! Easy!

I spoke too soon, however. Within 30 min to 1 hour of operation, the vac started crapping out - would stop and act dead - like an open connection, or a tripped overload device (don't know if the motor has one or not, just speculation). After letting it sit for some undetermined period (the next time vac was needed) it would run again for another period and repeat the problem.

I have not done ANY troubleshooting, so there is no positive evidence linking this behavior to the washing. Perhaps the washing dissolved some glue on some piece of insulation, or soaked and swelled a piece of paper insulation, or similar such damage so as to cause the motor to overheat, or trip.

Perhaps this would have happened regardless of the water washing.

I know that there are devotees to this technique, but I would venture to say that one should think carefully before exposing any equipment or components to water or any other solvent or agent (remember that water is

the most universal solvent there is) in which that equipment was not specifically designed to be operated, or with which it was not specifically designed to be cleaned. Most electronic equipment was designed to be operated in air only (clean, dry air at that - not the humid, corrosive atmosphere we all experience), and to be bathed in the same. I know that's boring, but that's the case.

Contrary to common knowledge, water (especially pure water) is an extremely aggressive chemical agent. Often, the fastest way to ruin a bare metallic surface, or any other for that matter where the electrical properties of that surface are the ones of interest (like contacts and elements in pots, switches, relays, etc.) is to etch the surface with some cleaner (etch here being defined as the removal of some desired surface layer or passivation) and then to deposit a new undesired layer of organic and/or inorganic residue, with electrical properties all its own.

That new layer of residue, or the smear from something else nearby that was washed away, might oxidize or corrode or attract airborne dust over a long period of time and cause premature failure of the component.
This is what happens when lighter oil (or worse, WD-40) is used in a bearing or part that needs heavier grease - it cleans it up nicely but then attracts dirt causing earlier failure, perhaps because you washed away some lubricant from some inner critical surface that will not be relubed when you spray in the wrong lubricant from the outside. And this is just from a mechanical perspective.

This is why I suggested recently beginning a thread to enlighten the readership on materials topics - someone asked recently about Rat Shack tuner spray, and if anyone had a better one to recommend. That's fine, but what we really need is to learn how to read the labels, and so if someone really knows the specific solvents and carriers in use, then that knowledge may be useful the next time he wants to choose between RS, GC, or whatever other brands might be out there. They may all be similar and that's useful to know too. Many (most) solvents have been banned from sale for environmental reasons. Anyone know which ones they are, and which ones are still for sale?

The presence of water is scrupulously avoided at many critical stages of electronic and device manufacturing. It has already been suggested to use other solvents very carefully, especially with old radios containing paints, finishes, and glues from bygone eras which may wash away if cleaned without forethought. Think before you wash that old rig!

I close by saying that I have NEVER tried this, while others have.
This was a purely theoretical discussion. Disagreements are welcome.

73, Kalman WD6CZI <klaudon@pica.army.mil>

:
: Several net-folk have recently mentioned the TH-28A but I've seen no comments
: on the FT-530. Has anyone seen or used one?
:

I assume you really mean the TH-78 Kenwood. The TH-28A only
receives on 440. It's keypad isn't illuminated, either.

I recently spent an evening comparing my Yaesu 530 to a friend's
TH-78E, just for fun. There's no clear "winner" (there usually
isn't), it depends on what you find important. Below are the high
points of what I saw. It's important to note that I'm much more
familiar with the 530's operation.

General comments: Features are roughly comparable except the 78 has
a major added feature of being able to alphabetically label memory
frequencies. Very nice for remembering what those seldom-used memory
channels are for (where's that repeater?). The TH-78 is the ultimate
techno-geek HT; it's even got a games mode (!)

The Yaesu, however, has a feature not found on the Kenwood: battery
voltage. You can get a constant readout of voltage, unless you're in
dual band mode where it's a button press away. I find this very
useful to plan when to charge the battery or to know how much I can
talk. Nicads don't discharge with a linear remaining capacity vs.
terminal voltage curve, of course, but with one or two cycles you can
get a good feel for where you're at. The Kenwood does give you a
less useful relative battery charge indicator when you transmit (only
on low power?).

Direct feature comparison:

Duplex operation-
530 - Always in duplex mode if both bands on, be careful when
transmitting on one band and listening on the other; you'll
retransmit what you're listening to unless you turn down the
volume. This may be a bug, because it seems to occur even
if the receive audio is sent to the earphone.
78 - Automatic mute of receive audio when transmitting, but can
program to be in duplex mode like Yaesu's

Both have cross-band repeat functions. Both can receive 2 2 meter
or 2 70cm signals at once.

Earphone/External Speaker
530 - Can select which band goes to earphone independently when earphone plugged in.
78 - Limited selection of speaker/earphone split. It didn't appear to be possible to talk into speaker mic and listen on internal speaker when doing 2 meter only operation, for example.

Audio
530 - 300 mW at 5% distortion, spec'ed. Seems to have somewhat better audio than Kenwood.
78 - 200 mW at 10% distortion, spec'ed.

Messages
530 - No message sending capability. Okay, maybe a very basic capability using the paging system.

78 - Can pre-program and easily send fixed messages, or painfully send random messages. Limited to (I think) 8 chars. My opinion is that this feature may not be very useful, somewhat of a "gee whiz" thing.

Paging/CTCSS Squelch/DTMF Squelch
Both radios have essentially identical paging and squelching capabilities. Usability is different, but it wasn't clear which was better.

Power Levels
530 - 3 on 7.2 volts (2/1.5/.5); 4 on 12 volts (5/3/1.5/.5) Rel power indicated when transmitting, but LCD indicator ambiguous when it says "low" ("low" is anything that's not high). 3 watt output would be nice to drive an amplifier and not heat the rig up so much.

78 - 3, (5 or 2.5/.5/.02) 20 mW could be nice for close-in work, or maybe hitting close repeaters.

Vox
530 - Some built in support for Vox (delay, sensitivity). Vox headset is cheaper than Kenwood's, possibly because the support is built in. I'm not sure how useful Vox really is, generally.

78 - Vox headset available, no specific built-in support.

Memories
530 - 41 for each band (82 total).
78 - 50 (standard) 250 (expandable). If you use alphanumeric labeling, divide by two. The 78 apparently lets you assign any memory to either the 2m or 70cm side. I'm not sure of the usability implications of this, good or bad.

Both units seem to store pretty much the entire state of the machine in a memory.

Ergonomic stuff
==========

Knobs: Two rotary "step" knobs on the Kenwood are multiplexed between volume and frequency on the two bands via a shift function (E.Chng). The Yaesu has a more conventional 3 knob approach, 1 (pot-like) volume for each band and a step tuning knob which tunes the transmit band. Maybe some people like the Kenwood approach and find it usable; I found it awkward, certainly not as easy to use in a car with one hand. I also like the feel of the non-slip rubber coated Yaesu knobs better.

Buttons: The 530's buttons are good size and easy to press, the 78's, smaller and fussier. The 78 does have some presumably often-used buttons laid out in easy reach of your left thumb, but not illuminated. Could be nice once you get used to the "feel".

Keypad cover: The 78 has one, the 530 doesn't. Could be useful to avoid accidental button pushing (a real concern with these HTs). Of course, you can always lock the keyboard.

Lighting: Both display and keypad are lit on both HTs. I'd give the edge to Yaesu here. The keypad lighting on the Kenwood was a bit weak. The Yaesu is very bright and clear on both the display and keypad.

Scanning: Similar, but Kenwood has an additional scanning mode which includes the call channel. The Yaesu scans about 2x the speed of the Kenwood.

Intermod/Spurious signal rejection: I'd give the edge to Yaesu on the 2 meter side. I didn't get to check the 440 side out, but I know my 530 is pretty susceptible there. Previous posts have dealt with a possible problem in the 530 on the 440 side that may be worse than what is "normal" for HTs now.

So, there you have it. Hope you HT buyers find this useful. When I was looking, the 530 was about 80 dollars cheaper. I decided that the alpha labeling wasn't worth 80 bucks. Now the price differential is closer to 50 dollars. I like the ergonomics of the 530 and wouldn't trade although I'm sure one could be happy with either, unless you really want the alpha labeling (get the TH-78), or DON'T like the spurious signal problems (don't get either one).

OK, some points to ponder: Avoid washing ANYTHING that is make from paper or cardboard. Avoid washing meters and tuner dials ESPECIALLY ones with painted radium dials! That old radium paint WILL wash off with water and it's actually quite an environmental hazard, not something that should be just washed down the driveway and into the street!

These aside, I can vouch for using Formula 409 household cleaner on old, vintage radios. My R390 and its sideband adapter got this treatment. I removed the meters, the tubes and all the covers. I pumped a generous coating of 409 over the whole mess and waited an hour. Then I pumped another coat on and used a (don't giggle so loud!) toilet brush to agitate the grunge loose. Then I just

turned the hose on it and washed it clean. Leaving the units to dry in the sun for the rest of the day. The chassis' were almost perfectly clean! There were a few minor spots that I took some acetone to to remove (?) something that was apparently not water soluable. I put the meters and tubes back in, lubed up the gear train in the VFO, applied power and it's been working fine ever since! (this was 5 months ago...) I just did the same to an old Johnson Viking II CW & AM transmitter..it's cooking ok too! I'm planning to try the dishwasher trick with my newly aquired Gonset GSB-100..I'll let you know how it does..

Folks,

I carefully took my Drake mic and my Kenwood mic apart to protect the electronics, then place them in the disk washer with the other dishes. I added the usual (lie, lye, SP?) dish soap and the softener.

Well, they went in black and gunky, but came out variegated gray and clean. So, now we know. The dish washer fades them. It may have been the lye soap that leached out the color, maybe other soap would not cause the color change, but I probably won't try it again.

So how does one go about learning how to use one of these things? I'd like to play with CW, and would probably benefit in the long run from *not* learning on a straight key (and have to unlearn it). Is there a general preference for using a keyer (how many kinds are there?), or do most folks just stick with the original telegraph-style key? OR, is this a question like "what's the best text editor"?

A DL said:

They say "Fuennef" (you see the similarity to "Fuenf"?). But I don't know the reason why, perhaps they think this will make it clearer to understand.

"Fier" and "Funf" can sound very similar in the noise (same number of syllables and a aspriation at the start).

Is this similar to "niner" rather than "nine", or "affirmative" and "negative" for "yes" and "no", or "say again" instead of "repeat" (although to a artillery forward controller "repeat" means the fire another salvo at the same coordinates -- a bit of a difference!).

: 'Course, for what Motorola charges, their gear *ought* to last forever...:-/

When I started shopping for my HT a couple of years ago, I was very disappointed to find that Motorola doesn't seem to realize that Ham Radio is a viable market... too bad that somebody like the ailing Government Products Division doesn't think to try to adapt the Motorola HT technology to the Ham bands. I think some of their HT's already have DTMF pads, so all that would be necessary is changing from a xtal control to a synthesizer. (As for CTCSS, well, Moto invented PL! ;-)

>realy boggles the mind ...
>
>Try something a bit more reasonable Chuck ... :-}

I wish more people would try using FM HTs on microwaves. Sure, it
doesn't work as well as CW between skilled operators, but who says
you have to use microwaves on difficult paths? I've had numerous
contacts of up to 80 miles where FM would have worked just as well.
Actually better, since there more tolerance of frequency drift.
The USB/LSB problem also goes away.

I find that 142 MHz makes a nice IF for a 222 MHz transverter.
It is easier to filter out the 3rd harmonic of the LO than if you
used a 144 MHz IF. It should work for 432, though I haven't
built the hardware.

Surplus microwave oscillators often have crystals in them that
might be usable if your IF out of the amateur bands. Not only
is it cheaper, but crystals do seem to get better with age
(frequency stability). Thus, the old one often works better than
a new one. Different IFs are recommended for experimental work--it
makes it easier to determine that you are indeed making a contact
on the frequency you think you are operating.

Finally, if you want to be cautious, get a scanner directory and
find out if anyone is using your IF before you go to that hilltop.
You might even check out the known/possible spurious products to
prevent potential problems.

>some piece of insulation, or soaked and swelled a piece of paper insulation,
>or similar such damage so as to cause the motor to overheat, or trip.

Most likely you washed out all the motor bearing lubricant. If rusting
hasn't started, you can relube the bearings and it should be fine. To
prevent rust, it's important to use very hot water that will evaporate
off quickly. Use of an oven on low will help accelerate the drying process.
Use of _Cascade_ or other wetting agent will also help avoid rust and
speed drying. Use to compressed air to dry the equipment is also encourgaged.

Water *is* corrosive, and should be removed as quickly as possible.
Water can also attack paper insulation materials, but these are usually
varnished and can stand short exposures to water. High temperatures
can also melt waxes that are sometimes used in older equipment to fix
coil slugs in place. Freshly melted candle wax can be used as a replacement.

In normal practice, it's better to disassemble equipment as far as
possible before cleaning. This allows you to segregate parts that
need special handling from the bulk of the equipment that can be
washed in ordinary fashion. Cold freon baths are the safest way to
clean electronic components, but the Greenies frown on it. Carbon
tetrachloride, alcohol, or hot soapy water are alternatives. You
should expect all lubricant to be removed by any of these treatments.

This is critical for motors, variable capacitors, and most importantly
for pots. Dry pots are quickly ruined. You should immediately spray
Quietrol into any pot as soon as the solvent is removed.

Possibly for the same reason the American Military says "niner"
instead of nine. I spent 15 years in the Army most of it in
the Signal Corps. And I still don't know why!!

190. QRP power on the TS-850 ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-17 12:53:00 UTC
From: jman@nyx.cs.du.edu
Message-ID: <1993Mar17.125300.20709@mnemosyne.cs.du.edu>
Source record: 284012

Is there any way to reduce the output power on the TS-850 from the minimum of 10W to 5W. I read somewhere else that this might affect the automatic ATU ? I suppose I could use an attenuator, but this would affect my sensitivity. Any other hints and kinks about this rig would be welcome. Please reply by e-mail. Thanks,

John, jhl14@phx.cam.ac.uk

191. For Sale: Kenwood SM-230 Station Monitor

Newsgroup: rec.radio.amateur.misc

I have an SM-230 with all cables and paperwork (including the boxes) for sale.
This unit has had very little use. It is in mint condition and works perfectly.
The list price is just under $1,000 and AES sells it for $900. I am asking
$800 plus shipping.

>
>Greg KD6KGW

I used a straight key exclusively for about a year (if I remember correctly;
it was a long time ago), going from ~5 WPM to ~18 WPM. At some point I got
my first keyer (not iambic). It was a Heathkit with a single paddle which
the operator pushes left and right. I kludged a squeeze key using thin
wooden "paddles", machine screws for one side of each contact, and rubber
bands for tension. Now I have Bencher paddle connected to the internal
keyer of my IC-735 (bad choice (the keyer that is), get an external one).
I occasionally go back to my original straight key as part of my CW play.

To get to the point, don't worry about having to unlearn the use of
a straight key. I use my keyer because I can only send about 15-18 WPM
half decent with a straight key.

I like to play with CW, too!

193. Icom no fail memory

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-17 14:29:09 UTC
From: jwa@tellabs.com
Message-ID: <1993Mar17.142909.4917@tellab5.tellabs.com>
Source record: 284048

I think I have the first R71 with 1024 memories. I can access
32 banks of 32 memories by rotating the memory knob on the R71.
On of the wires from the memory board's ribbon cable connects to
the speech button (on the on the radio's front panel). By simply
dialing a memory and then pressing the button, the radio jumps to
a new bank of 32 memories.

One drawback is that the radio cannot scan all 1024 locations.
During scanning, it stays in the same bank an scans the 32 memories.
However, I figured it would be impractical to cover the full range.
Because the radio scans so slow it would take forever!
I like the extended memory because now I can store the Top 500
Utility frequencies and still have plenty of room.

The RAM circuit draws 660 uA during backup mode and I calculated that
the batteries will last about 3 years. It's a bit shorter than the
original ram unit, but, after all it there's 32 times more memory!

SOME QUIRKS!

When the backup battery is disconnected and you turn the radio, I found
that sometimes the radio will display bogus characters (for example
160.0o30). I also found that some memories will display " . . " and
you can't tune or even enter a frequency from the keyboard. Other times when
you tune the radio it may display a correct frequency (like 20.000.0)
but when you tune the display jumps to .000.0 and it locks up!

in spite of the quirks, I found that you can recover from it. When you
first turn on the radio, the first thing thing you do is enter a frequency
from the key board. Then press the A=B button and the WRITE to initialize
the VFO's and memory 1. Then dial the next memory and press WRITE.
If you store each memory with a good frequency, you won't have the lock up
problem. You also have to invoke the 32 banks while in vfo mode. This
updates the scratch pad data (in which the processor uses in it's main loop)
and prevents lock up when the banks are selected during memory mode.
By changing jumpers, the board can also be used in an Icom 745, 751,
751A, 271 and 471.

Before shipping the memories will be initialized and about 100 frequencies
will be preprogrammed into the radio. The frequencies will include utilities,
SW Broadcast and Ham radio. The memories will also be programmed with extended
frequency range. This means the radio can receive from 5 kHz to 31 mHz.

The boards are available from Willco Electronics P.O. Box 788, New Lenox, IL 60451.

194. Long Wire Sag

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-17 14:32:32 UTC
From: adams@chuck.dallas.sgi.com
Message-ID: <1993Mar17.143232.25157@odin.corp.sgi.com>
Source record: 284017

Gary Coffman, KE4ZV, in previous post gave a formula

S=(W*L^2)/(8*H)

for the sag in a cable suspended from two points of equal height.

S is the sag in feet
L is the length of span in feet
W is weight of cable (sic)
H is tension in the cable in feet (sic) :this should be pounds

i think that W should be the weight/foot of the wire(cable).

lets rewrite this equation as

S=(TW*L)/(8*H) where TW is total weight of cable.

this formula is a little more easier to monitor what is going on.
if we have a span that is six times longer, but keep the same weight, i.e.
use smaller wire, and keep the same tension, the cable will sag 6 times as
much. children, remember this.....

i wanna do this a little bit differently. let's work with a fixed length
cable, say 100 meters. the unit of measurement is not important here, as i
will illustrate later. let's make the total weight equal to 1 critter,
where a critter is whatever you want it to be, pounds are ok by me.
i dug out the old code and did the following calculations for a 100 meter
cable or feet if you prefer:

Span Sag Tension (at each end) divided by weight

0 50 0.500
50 39.83 0.503
75 29.44 0.563
90 19.07 0.744
95 13.59 0.983
96 12.18 1.083
97 10.56 1.233
98 8.63 1.488
99 6.11 2.075
99.5 4.31 2.917
99.8 2.72 4.614
99.9 1.91 6.568

Gary was kind enuff to send me a table of figures for copperweld and copper
wire. i'll just demo with the copper wire. #8 weighs 5.0 pounds per 100 feet.

using the above table, if 100 feet of copper wire is to sag only 1.91 feet, then we would have to pull 5*6.568 pounds. Gary gave me the recommended tension of 84 pounds, which i shall interpret to mean that anything above this will either stretch the wire, cause it to break, and/or shorten the lifetime of the antenna. so we are within the limits specified.

for a 600 foot cable, where this all began with a question about a rhombic antenna, multiply the table figures by 6. in the case of 600 feet, a sag of 11.46 feet will result for a tension of 6*5*6.568=30*6.568=197.04 pounds, which is too much. of course, a sag of zero can be obtained by an infinite tension, but separation and lift off will occur before this happens. ;-)

Gary can comment on this, since he's probably destroyed or few or might be willing to do so after this post. i use ceramic insulators about 2" long, and they are almost square looking from the end. i think one of these critters will break before the wire does. don't know for sure. that's why they a set so that the wire will hold if the insulator breaks with the loops interlocked. but you knew this.

oh. the sag is the distance between the lowest point and the horizontal line between the end points.

ok. use the above table and scale it by length and weight density to get what you need. guess i'll have to do a complete article for QST on this. maybe get it in the ARRL handbook. my program is cable of working with cables suspended at intermediate points by balloon or varying lift factors. guess i could do kites and balloons at the end also.

sorry to use of bandwidth for facts. :-)

thanks to Gary for the data points. i'm not picking on him and i don't think that he's picking on me either. see you at FD Gary. :-)

I'd say there's enough difference between a straight key and a keyer
that there's nothing to unlearn when switching back and forth.
Straight keys require more attention to the quality of the dits and
dahs, so I find after using the keyer I'm likely to be quite sloppy
with the straight key. The keyer gives you a lot of latitude while
producing perfectly timed components.

Well... What if KB9XXX hears DX9XXX and sends the dx station a
card with the two call signs?

>So what is the deal here? Is there really some awards issuing
>organization that will not accept cards unless they clearly
>indicate that I had a "two way" contact with someone?
>

I have a friend who was a ham in Romania (KB9HAY now). To get the
first level license he had to get 100 (not sure about the number -
could be larger) SWL-QSL cards.

After that he had to again get a number of QSL cards for 2-way
contact before he could upgrade. The ministry was very picky
about requiring the cards to be explicitly labelled "2-Way"
or "2x" or some such.

The highest level of license allowed you to put out 400W. There
was however a catch. You had to build your own amp, demonstrate
that you understood its working and that it met the law.
It would be spot inspected at station by an inspector who would
check the working of the amplifier. It had better not be capable of
making more than 400W! (The limit). If it passed then that was the
amp that you were allowed to use.

These are my recollections of a presentation that Relu, KB9HAY,
made to our club a year ago. He left Romania in 1990.

Oh to be back with my SB101 mounted in my '67 Ford Galaxie 500
convertible with the Hustler antenna hitting the tree limbs. I think
about it every time I trip over the mobile power supply and mount in
the garage. Took it out so the girls could sit closer, then bought a
Jap car where it couldn't possibly fit. Things haven't been the same since.

Still use my SB101 (supposedly up scale from the HW101 though I was
never convinced). Only repairs in 25 years have been to replace the
rotten rubber belts which gang the tuning and loading controls with big
rubber bands. Course two of the ten meter ranges never worked--still
don't--I'll have to fix that some day.

>Please reply by e-mail. Thanks,

No problem. My TS850s goes down to 5W when the power knob is cranked down. It put out the required 10w for the ATU when the "Tune" button is hit. Nice huh! It turns out that the 850 has a really fancy power control function that interacts independently with the ATU - which sets its own power level.

There is a pot, easily accesible from the bottom hatch, that allows you to turn the minimum power down. I can look that up in the Tech Ref manual if you would like.

BTW, talking of tech ref manuals - the TS850 manual upsets me a little.
* cost: $50+ with shipping
* in many parts of the manual it says - "Refer to the TS950S manual for details" UGH!!!

204. OMNI VI - 80C32 cpu

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-17 16:16:54 UTC
From: wstrahl@cbnewsg.cb.att.com
Message-ID: <1993Mar17.161654.22013@cbfsb.cb.att.com>
Source record: 284025

Need help and suggestions from computer literate folks out there!

I have a Ten-Tec OMNI VI which uses a 80C32 cpu with the firmware on a 27C256 eprom. Being the curious person that I am and given that the rig uses a menu selection routine, I'm curious if there might be room left in the eprom for some "custom" features or modifications and just to understand how the control logic works. I used to be a pretty fair Apple IIe hacker and made up some custom ROM's for that thing, but I really haven't kept up too well with the PC stuff.

I have ready access to a ATT PC6300. My questions are...what will I need to read and disassemble that EPROM? Any recommendations/experience with common EPROM cards? What will it take to work on 80C32 software on my PC compatible? Where can I get the appropriate stuff I'll need?
I have a rather high frustration tolerance level but I need help just to 'begin' getting this idea off the ground!

Thanks group!!

Is there any 2m/440 HT that doesn't have those problems?

Hmm. How much *is* a good turns counting dial? This might be a good application for a microcontroller; the micro itself could have the chart programmed into its EPROM (after initial experimentation), and could probably be done for under $20 (assuming the usual well-stocked junkbox with cheap surplus parts), with the most expensive part being an NVRAM to keep from having to rewind the inductor to one end when the power goes off. You could sense shaft rotation and direction with a couple of slotted optical switches and a pair of "flags" attached to the shaft.

Hi,

If you decide that the dishwasher will hold the device ok, use 2 or 3 DROPS of regular dish soap. Regular dish soap will foam up like crazy so don't pour in half a cup... the XYL may not think a kitchen full of foam is all that amusing (or maybe she might). Regular dishwasher soap is nasty stuff and shouldn't be used on items that aren't all that dirty since the soap tends to eat paint off front pannels and such (sad experience).

The important thing to remember is that water and specially with soap added will remove most if not all lubrication.

I wash fans and motors and the like all the time but the lubrication must be restored to the bearings and light graphite sprayed onto brush housings to keep the mechanics from rusting shut.

Another real important thing to remember is to power dry the unit. If a chassis or motor is left to drip dry slowly over several days it is almost guarenteed to make rust or other grungie things will happen. The way to power dry is either with a hair dryer at a safe distance or set the chassis in front of a box fan running at high speed (Chassis leaning up against the grill so that the maximum surface area is being blown upon).

Observations from the front line...

John (WA0LHB) in das Fort

210. "Real Future of Ham Radio" (Was: FL hams...tower, stop Xmitting)

This particular message started to make me think about the "Real Future of
Ham Radio" in the USA. I could be sorry I started this thread and I could
be opening a Pandora's (sp?) box but here we go.

As technology has progressed faster and faster, we seem to be coming under a
greater pressure from commerical entities that want our spectrum for new
technologies (as shown by the infamous 220mhz grab and failed ACSSB use.)
and by the "annoyance factor" as shown above. It appears that although our
future is not totally bleak, we may be in for some rough times ahead. While
I am not a doom and gloom proponent, I do believe in "Being Prepared".

The following is for example only, please keep discussion to topic
A semi-related example is that those of us who like to hunt are finding it
increasingly difficult to find public hunting lands for a variety of reasons.
We are now increasingly forced to buy land to secure our sport.
The above was for example only, please keep discussion to topic

If the government releases 200mhz of space, this is still a finite amount of
space and where will they look to next for more frequencies for commerical
entities, especially if the new technologies appear to obsolete the need
for our emergency communications in the government's eyes.

The question then is:

Should we as collective individuals and/or the ARRL bid for some of
these frequencies that will be auctioned off, especially if any are
auctioned off in blocks? (ie. continuous 1mhz block)

If the abolition of ham radio as a public entity should come about then the
continuation of ham radio as a private entity will already be installed.

One last thought, would we bill the government for emergency use of our private frequencies. :-)

Oh Well, we can always take over GMRS. :-) ;-)

}to freq ?"

I used to get that kind of garbage from the AF-MARS frequency
gestapo.

I'd like to know HOW they can tell that you are off frequency
when you're operating Silly Side Band, with full carrier suppression,
and they don't know what your voice sounds like...

Obl O.F. comment follows...

Back in the early days of RTTY, when you joined an autostart channel,
you had to be +/- 10hz or some of the guys couldn't print you. This
is because many of the stations were unmanned or xtal controlled.

Now as long as your VFO is somewhere in the CW portion of the band
it is close enough...

>>carefully -- though I did read it reasonably well when I first

It's in the ARRL Operating Manual quite clearly. Page 3-25:

"Leave no doubt that the QSL is confirming a two-way contact
by using language such as 'confirming two-way QSO with,' .....
before the other station's call"

If amateurs would recall, now and then, what the term "QSL"
actually means, this problem wouldn't crop up.

Automatic dishwashing detergent does not contain soaps; the main component is chlorine bleach, a very powerful cleaning agent, especially when used at the relatively high temperature (140 F) of dishwashers. Other components
include perfumes and wetting agents. The chlorine is why your parts faded in color.

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
-
1. Printouts of Volunteer Examination session
opportunities in his/her area.
-
2. Listings of Amateur Radio clubs in his location.
-
3. Helpful promotional material about the Amateur Radio
Service.
-
The already-licensed individual might well be interested
in another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely
points out how the ARRL National Traffic System and the
ARRL Amateur Radio Emergency Service function as a
cohesive unit to provide the maximum support to the public
both in times of disaster as well as "normal" times.
-

To obtain either of these free ARRL services, please
provide me with:
-
A. Your name
B. Your mailing address
C. A Specific request for either of the two services above.
-
73!
-

Yeah, I typoed too fast. :-)

W is weight per foot of cable
H is tension in *pounds*

My worked example was correct.

[delete]
>for a 600 foot cable, where this all began with a question about a
>rhombic antenna, multiply the table figures by 6. in the case of

>of zero can be obtained by an infinite tension, but separation and lift off
>will occur before this happens. ;-)

This value is acceptable for copperweld however. #8 copperweld has a recommended tension of 195 pounds. This is a rule of thumb value used by the industry that equals one tenth the breaking load of the wire.

A caution on your table, it's for hard drawn copper. Soft copper, which should never be used for antennas, and copperweld have different weights per foot, and different yield strengths than hard copper.

>Gary can comment on this, since he's probably destroyed or few or might

>these critters will break before the wire does. don't know for sure.
>that's why they a set so that the wire will hold if the insulator breaks
>with the loops interlocked. but you knew this.

The insulators are designed that way for two reasons. Ceramic is strongest under compression, weakest under tension. Therefore the wires are arranged to compress the insulator. Secondarily, this configuration also allows a safety catch should the insulator break.

The ceramic is *really* strong under pure compression, though it is fragile under shock loads. These type insulators should be able to tolerate at least 2,000 pounds of compressive force. (A number of factors, mostly concerning load spreading and contact geometry can lead to lower or higher yield strengths. Specific testing should be performed before the insulators are used in actual service. Your mileage may vary, etc.)

Gary

Jack Hamilton (jfh@netcom.com) wrote:
:
: Is there any 2m/440 HT that doesn't have those problems?
:

Hmmm, good point. Haven't heard of any clear winners in the dual-band arena, but I wouldn't call myself very knowledgeable, especially when it comes to Standard or even Alinco. Someone mentioned that the 530's predecessor, the FT-470 was decent for a dual-bander. It seems like the relation is currently: Spurious Signal Sensitivity is directly proportional to Wideband Receive Sensitivity. The FT-470 sensitivity dropped pretty quickly out-of-band.

How about an internal bandpass filter that's switched in when you're in the ham bands and switched out otherwise? Might not add much to the cost of these rigs and would make them much more usable in urban environments. Or, on those HT amplifiers, substituting a bandpass filter that can be switched in or out for the pre-amp that many of them have...

Since the 80C32 is a member of the 8051 family, I would guess that there are some cheap/free disassemblers available. I would post to sci.electronics and ask. Before you do that, why not give Ten-Tec a call? Agreed, this sounds a bit of a reach even for their legendary support, but they just might give you a peek at the code.

You'll need an assembler to write your own code. Again, ask on sci.electronics. There is also a good book that introduces the 8051 - can't remember the name off-hand. E-mail me and I will get the details. It includes a disk with a decent assembler. Then you'll need something to burn the EPROMs. Nice little EPROM programmers are available that should work in you 6300 for around $100-150. Needham's Electronics comes to mind. Check out issues of Computer Craft and/or Circuit Cellar Ink.

Of course, this will not get you any debugging capabilities (i.e. ICE). You'll be working in the "burn-and-crash" cycle. A guy around here got a nice little ICE and programmer for the 8051 for about $350. Hope this helps. 73 de AA8DX.

I recently "upgraded" from a 470 to a 530. It was sort of an impulse based on the new mic, more features and an offer from someone to buy my 470 (which fell through :-( ) So far I don't think I've discovered all the new features.. When ever I get a chance I spend some more time scanning the owners manual and pushing buttons. The most outrageous feature I've come accross so far is the battery saver mode the functions under TX! Some of the features that I used to toggle on & off often on the 470 aren't as straight foward, but I'm sure I'll memorize the key squence. There's always the quick reference guide (something that can frustrate you real QUICK if your in a hurry...) The only thing I really miss is the extended UHF recieve I had on the 470. Hopefully someone will discover how to do it from the key-pad...

Folks,
I'm comparing two Kenwood handheld VHF units, and was
wondering if anyone has any opinions about or experience
with either or both of these units.

1. The "budget" option is a Kenwood TK240D,
22 channel scanning programmable with LCD display.
My source can get me this for about $540 with battery.

2. The "luxury" option is a Kenwood TK230SCKA,
20 channel scanning programmable with Alphanumeric display
and greater battery capacity.
He's offering me that one for about $800 with battery.

He says #2 is larger and more durable (part of my use is game warden
work, which can be rough on gear), and has more options (like a shoulder
mount speaker mike). He also says #2 has better sound quality, and I can
imagine that the alpha display is a nice feature. But there's a
considerable price difference, so I'm more than a little hesitant.

Are there other tradeoffs which might help me make an informed decision?

Thanks!
Steve Frysinger

It is not at all silly! What a narrow minded reaction! There are
countless reasons for experimentation out of band, some related to
amateur radio, but many unrelated to amateur radio. There are all
sorts of scientific research applications involving radio frequencies
that a good ham radio would be ideal for. The alternative for the
researcher is to buy professional equipment at 5 times the cost. There
is nothing wrong with transmitting at any frequency, provided that you
contain your emmissions via adequate shielding. I am as annoyed as
anyone any time I hear illegal emmissions, but it is not right to deny
people the right to perform legitimate experimentation just because
a few individuals might mis-use the capability.

I'm trying to build a crystal oscillator using cheap microprocessor crystals. I can get a crystal that is half the frequency I want, but I can't find any books that have doubling oscillators in them. Anybody out there know of such books?

I looked into a hybrid sine oscillator module, but it would magnify the cost of my project by about 10 times.

Help,
Galen, KF0YJ

>frequently "talked down" to youngsters or just pretended not to see them.
>They were demeaning to people who had questions or didn't appear ready to buy
>a full-up Collins station.

Sadly, this describes several recent experiences I have had at the _*HRO*_ in Anaheim.

>The Anaheim Henry store was eventually closed, and in a great twist of poetic
>justice, their old location is occupied today by HRO!

Has anyone checked to see if there is a old burial ground or something beneath this location?

Seriously, the HRO in Van Nuys is wonderful. It must be a cyclic thing that eventually strikes successful retail stores. After a period of declining sales, the good ones wake up and reaffirm their commitment to customer service. The bad ones (like Henry) dry up and blow away...

>>indicate that I had a "two way" contact with someone?
>>

The 2X is to distunguish a QSO from a SWL report. Unforutnately,
what the ARRL prints and what is needed are two different things. Don Search
at the DXCC desk would look at card and as long as it said "confirming QSO"
or words to that affect it was a valid contact. No RST was needed. If the
card was a fake he could tell by other ways. 2X is simpler in
international terms than "confirming QSO" etc.

As for awards chasing, dont worry. As long as it says "2X" or
confirming QSO" and gives the other guy's QTH, your ok.

That Van Nuys HRO has improved over the last 5 years, but there have been so many different managers/salespersons there it is a real revolving door! The worst of their service seems to have involved their Station Setup services. The guy who did one installation I saw (and ended up fixing!) wired the rig ground lead into the power box's ground so the neighbors got plenty of RFI and the antenna setup was marginally safe. In all not a $200's-worth of real service.

(Hiya Greg! Say hello to Dr. Bob Rice for me! tnx!)

If you don't need "pretty" consider an ARC-5. These WW-II surplus
transmitters still show up at ham flea markets, usually for $0 - $5 or so.
They include a nice dual-variable cap (VFO tuning) and a roller inductor
complete with tuning dial (a plastic window with calibration markings
for the moving roller contact.) Rip out the tubes and other circuitry,
and they convert into a very servicable antenna tuner.

Source record: 284049
Cross-posted to: rec.radio.amateur.misc,rec.radio.swap

Can anyone offer any help ..??

I am back into amateur radio after a 4 year layoff ..

I am considering the purchase of a HF rig .. I used to
own a TS-440 that I liked alot .. but I must confess
I only used about 20% of the features of that rig ..

This time around I think I would do better with a
simple rig like the TS-140. I can only put up a
vertical antenna .. and I am not a serious
contester. I would like to do alot of Shortwave
listening .. I would like my 8 year old daughter
to share in the shortwave listening ..

Now for the question .. Does the TS440 have a
much better receiving and transmitting section then
the TS-140 .. If I spend the extra $$ for the TS-440
is the money spent on the features that I never use ..??
If the TS-440 has more to it than extra features .. are
the benefits negated by the vertical antenna ..??

Can anyone suggest other rigs I should be looking at ..??

Thanks in advance ..

-Fred

Ok here's the scoop, this event is a traditional classic that we've been doing for the last 6 years and it's a lot of fun especially for Operators that have *never* heard older, tube-based gear on-the-air:

QSP de KA6PVR, March 20th is "BOAT ANCHOR NITE" on the T&A 10m Net starting at 12:10am PST and running till the last Operator drops off to sleep! 28.310 USB A chance to hear other vintage rigs, a excuse to fire up that old Drake/Johnson/Gonset/Hammerlund/Collins/ HeathKit/Harvey-Wells/Globe/Elmac/HRO/Hallicrafters/National/Galaxy/ or homebrew rig! See if it works! All Modes welcome! Bring an Attitude!

So if you're a nite-owl, an insomniac, a speed-freak, or just like to be awake at 0810z - Try us out. Better yet, dust off that "Golden Oldie" you've been hording in the closet/attic/basement, check it out, see if it runs! Fire up and join us on 28.310 MHz - 73!

OK, we've now had some "they stink" reviews, and some "I love mine" reviews. I'll throw my hat right smack in the middle of the ring. Mine's OK.

I asked for, and got my 580 for Christmas this year before I actually had my license. I chose it based on features that at the time I thought I wanted. Dual band, and extended receive with Aircraft AM receive capability. I'm a pilot, and really wanted the airband stuff in combination with my HT.

My comments as a newly licensed ham? Next time I'll buy a seperate airband receiver or scanner for out-of-hamband receive thanks. The problem? EXTREME sensitivity to intermod. I live in a medium size rural community (Greeley, CO for the curious) and at home using just the rubber dummy, several local repeater frequencies are literally wiped out by intermod. Drive to Denver with the thing and I might as well turn it off. Hook it up to the Larsen 2/70 antenna I put in my car? Hah! I guess I expected some problems when hooked to a good antenna, but to have problems with the supplied antenna in a relatively rural area seems a bit much to me.

Is mine more sensitive than most, or is this a problem others are experiencing?

Except for the intermod problems I generally like the radio. Despite other opinions I think most functions on the radio are easy to get to and relatively obvious after just one quick trip through the manual. Watch out for the clear-all function "feature" though. It's just too easy to reset the entire radio. All it takes is holding down the function key (strategically located just above the PTT) while turning the radio on. I've done it, every other owner I know has done it, and you'll probably do it too.

All in all, a mixed review. It's possible my extreme intermod problem is not a general problem but it sure is driving me nuts.

237. BULLETIN: Quarterly Disk for Jan-Mar 1993 Now Available

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-17 20:58:35 UTC
From: oler@rho.uleth.CA
Message-ID: <9303172058.AA21786@rho.uleth.ca>
Source record: 284054

/\

ADMINISTRATIVE BULLETIN

17 March, 1993

Quarterly Disk for Jan-Mar 1993

/\

QUARTERLY DISK FOR JANUARY TO MARCH 1993 IS NOW AVAILABLE

Our quarterly disk for January to March has been released and contains 2.3 megabytes (compressed on a 1.44 megabyte 3.5" HD disk) of solar and geophysical information in over 100 files for the first quarter of 1993. A complete description of the contents of this disk follows below. Contact: Oler@Rho.Uleth.CA, or: COler@Solar.Stanford.Edu, or call our computer BBS at 403 756-3008 for pricing information for copies of this disk.

The disk includes an expanded, corrected, and updated database of auroral activity sightings from March of 1991 to March 16, 1993. This textual database is over 430K in size and is intended to replace the database included and used by our Dynamic Auroral Oval Simulation Software. A significant amount of additional information is also included, as described below.

Those who are subscribers to this service will receive this disk in the mail within the next week (or two weeks if you are overseas).

The contents of this disk follows:

==========

QUARTERLY DISK MAILING - VOLUME 1/2

MARCH 1993

Solar Terrestrial Dispatch
P.O. Box 357
Stirling, Alberta
T0K 2E0
CANADA

==========

Welcome to the STD Quarterly Disk for March 1993!

This disk contains high-resolution professional solar GIF images of notable solar events and the regions which spawned them. Also included is a

brief tutorial explaining how to interpret transverse videomagnetograms and the importance of identifying areas of magnetic shear. Images of actual transverse field line map images are included and are discussed in the tutorial.

Also included is an updated and expanded database of auroral activity sightings covering the period from March 1991 to 16 March 1993 (a two-year period). Our Dynamic Auroral Oval Simulation software can read this database and plot the positions of auroral activity sightings on IBM compatible MSDOS systems with VGA graphics capabilities. This is the most extensive list of auroral activity sighting information presently available. For those of you who own our Dynamic Auroral Oval Simulation software, copy this text file ("sighting.dat") overtop of the existing database file that was included on the software distribution disk (overwrite it). You will then be able to use the updated and expanded database with the auroral oval simulation software.

Included on this disk are copies of Solar News, a publication of Stanford. Solar News issues for December 1992, February and March 1993 are included on this disk. The January 1993 issue was not available for incorporation into this issue of the Quarterly Disk Mailing.

243. YAESU FT-411E MOD QUESTION

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-17 22:34:12 UTC
From: mgsail@prefect.cc.bellcore.com
Message-ID: <1993Mar17.223412.13432@porthos.cc.bellcore.com>
Source record: 283851

I am thinking about modifying my Yaesu FT-411E as an emergency backup for my marine VHF radio. Does anyone know if the mod to extend the transmit frequencies screws any of the rigs ham functions up? I know that this mod on the 411 (note the absence of the "E") disables the auto offset feature. Much obliged for any help.

Al, N1AL says:
>.....(3/4 wave is an odd multiple of 1/4 wave.)

Huh? 3/4 wave is an odd multiple, as is 1/4, etc. But since 3/4 is a
half-wave multiple of 1/4, then it's an even multiple of 1/4 wave.

>dropped pretty quickly out-of-band.

Yes, as a proud owner of said article, I can attest. Although I've never
really used any other models, I have not had any significant problems with
intermod or spurious signal response inside the ham bands. (I do hear
all sorts of weirdness as I exceed the units extended receive range, i.e.
I once listened to what I know has a strong local repeater with the VFO
set at ~135 mhz, its one of the rigs ways of telling you you've gone too
far) Compared to many other units (I have listened to a friends IC-W2A,
and he has had serious intermod problems) the 470 seems to have good
intermod resistence coupled with the reletively small receive coverage,
as you pointed out. My experience has been that the usable receive coverage
is about 138-170 or so on VHF and 420-470 or so on UHF.

>How about an internal bandpass filter that's switched in when you're in
>the ham bands and switched out otherwise? Might not add much to the
>cost of these rigs and would make them much more usable in urban
>environments. Or, on those HT amplifiers, substituting a bandpass
>filter that can be switched in or out for the pre-amp that many of them
>have...

I don't believe the 470 has such a pre-amp, but I don't know about any
other brands or models. The idea of having two front ends, one optimized
for scanning and one for ham-band receiving is definately intriguing.
What I would love to see, although I don't think the state of the art is
there yet, nor would I want to contemplate the price, would be a totally
digital setup, i.e. the "front-end" becomes an extremely high-frequency
sampler, and all processing is done in software, with some form of
optimized RISC processor doing the processing. This would allow you
to dial in a filter charateristic, and maintain it across enormous bandwidth,
not to mention the ability to make the thing receive essentially any mode
you want. I have no idea how much of this can be done with today's DSPs,
but I suspect that doing it in software this way is the way of the future.

Anybody got any ideas or thoughts (maybe it's time to start another thread on this if anyone's got any more ideas)

246. Help on mod to GE Custom Executive

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-17 23:19:41 UTC
From: HOFFMANMK@CONRAD.APPSTATE.EDU
Message-ID: <1o8bmdINN88i@lester.appstate.edu>
Source record: 284067

I have a General Electric Custom Executive which is an all solid state radio and is a fairly large underdash radio (i.e. controls for vol, squelch, channel select and the microphone are on the radio). Model number is RC56FAS66 and it presently is on 154 mhz. Anyone have an experience in getting such a radio down to 145 mhz.? Apparently the radio was part of the Mastr series, but it is not a Mastr Pro or Royal Custom, and I have only ever seen one other radio like it in about 25 years around 2-way radios and going to hamfests.

Any help in modifying this down to 145 mhz will be appreciated.

Thanks in advance for your help.

I would like to sell my Universal M8000 all mode RTTY decoder. It is version
1.07 which is the newest ROM to my knowledge. I bought it new in October
and am finding that I have too much RTTY stuff now so I will let it go`
for $1000. I will throw in the cables which allow it to connect to
two HF/VHF receivers too as well as the scramble cable for the RS232 interface.

This is the one that will decode digital pagers and Piccolo in case you
are interested.

It will also do a much superior job on Fax than the M7000 series as the
VGA monitor is put to really good use in this puppy! It also has a set
of nice tuning aids built in including a spectral analysis and cross
pattern both displayed on the monitor. It is a really nice unit, but
alas, I can no longer afford to keep it.

Compare at Universal for nearly $1200.

You will need a VGA monitor too but will throw mine in for an extra $100.

248. Kenwood TM741 selectivity problem HELP!!!

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-18 00:13:24 UTC
From: baxter@kuhub.cc.ukans.edu
Message-ID: <1993Mar17.181324.48210@kuhub.cc.ukans.edu>
Source record: 283839

After several years of using my old TM721, and yearning for a new dual bander with more channels, I finally broke down and bought a new Kenwood TM-741A. Boy, what a disappointment.

One of the big things that I had wanted to do with the 100 channels on UHF is to load in some of the public safety frequencies that I listen to. Unfortunately, once the radio is tuned above 449.995, into the out-of-band region, I get such intermod, that listening to much of anything is pretty useless. Having used an Alinco DR-570T for the past 3 years in my car, and never experiencing such problems, I was not very happy with this 'new' radio.

To describe the problem more exactly, it seems that there is very poor front end selectivity in the UHF section once tuned above 450. I presume that once in the 450-460 range, the front end filters are removed from the RF stage. Is there anyway to fix this problem? Are there any mods out there to eliminate this hash which keeps my squelch open most of the time.

I have not yet performed the official out-of-band mods to the radio, i.e. removing R54 & R55 -- will this help any matters?

I called Kenwood, and was quite annoyed in their response by their tech. I was told that their is a way to fix the problem, but it is proprietary information, that he couldn't tell anyone how to do it, and that was that.

Well, Kenwood, I have a few more days to try out your new radio before I box it up and buy something else -- unless anyone can tell me a way to get the mixing out of the front end of the UHF receiver.

HELP!!!

> and they don't know what your voice sounds like...

I've often pondered this myself. With a little practice, a human can tune SSB quite accurately, even without knowing what the sender's voice sounds like. There must be some information embedded in the signal that allows this. Here's how I think it works:

[total speculation mode on]

Consider the human voice -- each individual sound in a sentence has a distinct frequency spectrum (ie, Fourier transform). This spectrum is largely, but not exclusively, composed of harmonics of some small number of fundamental frequencies. For example, if A represents a 200Hz sound, a word-sound might contain A, 2A, 3A and 4A frequency components.

In a poorly tuned SSB signal, these will come out as A+e, 2A+e, 3A+e, and 4A+e frequency components. Notice that they are no longer harmonics of each other! I'd bet that your brain learns to cue off these harmonic discrepancies in order to tune SSB.

It should be possible (???) to build an automatic SSB tuner that works on the same idea. By capturing a snapshot of speech spectrum and then shifting it to find a "best fit" set of harmonics, it should be possible to deduce how far off the receiver is and then correct it.

[total speculation mode off]

: I'm starting out in RF design at varsity, and as usual the theory is coming
: thick and fast, but I'm still in the dark when it comes to practical
: matters, LIKE:-
:
: Would one need to _match_ an antenna to the front end of an RF preamp in a
: receiver? My GUESS is that a nice well-defined antenna (like a 2m dipole
: made from 300ohm flat line) is not really a problem. [Although RF
: transformers at that frequency are said to be quite lossy->is that right?
: What is the best way to do this really elegantly?]
:
: However, when it comes to a device like an RF remote-control receiver where
: size is a major factor (esp antenna size!) what does one do? Say for
: instance one is using a short piece of wire, does one assume a high
: impedance antenna and "guestimate" a match? What are typical impedances for
: this kind of antenna?!
:
The usual wisdom in the Ham radio world is that antenna matching is far
more important for the transmitter than for the reciever. As a single data
point, I've noticed that there's around 10dB difference in signals coming
from my old R-390 reciever between when I have the reciever connected to
the antenna through the antenna tuner vs. directly connected to the
antenna.

Most transmitter circuits are really pretty picky about what they're asked
to push watts into. If they get too much bouncing back at them, they do
nasty things, like shut down, or emit smoke (for brief periods).

All reciever circuits work at much lower levels, and so can tollerate having
part of the signal "bouncing" back towards the antenna.

There are other considerations, but these are often the major ones.

> RCA's. His reason, he had not been able to make any of the three fail.

I don't know. We had several RCA SuperCarPhones when we were in college. They had this nasty habit of getting the relays to stick (sometimes in transmit). The standard procedure for fixing the base station was to pick it up and drop it on the floor. A friend with a mobile unit had a large wooden mallet with RCA inscribed on it that he beat on the trunk unit with.

Later on I was in a volunteer fire department. The GE units we had on the equipment (hand held, base and mobile) as well as the Motorola Pak-ratt setup we had on the ambulance never gave us any trouble. We did again have an RCA mutual aid radio and it was generally considered to be worthless.

NG>is
NG>called a differential cap? I was thiking of building a transmatch with it.
NG>The
NG>circuit I was thiking of was the following

The circuit you posted is the classic T match circuit and does not
provide any harmonic supression. I suggest you you use the SPC
transmatch circuit described in all the recent ARRL Handbooks. This
circuit, will use your differential cap. if it is actually a dual or can
be converted. The cap. you need for the SPC most have both sections
increasing or decreasing the capacitance at the same time.

The advantage of the SPC circuit is that it forms a bandpass
characteristic in most matching situations.

Hope this helps

I own an FT-470 and I find it very sensitive to intermods. One of the reason why most HTs and mobiles are very sesitive to intermodes here in Canada is because pager transmitters are located just above 148MHZ. I don't know any receiver that is tight enough and not be affected by 5KW transmissions at 148MHZ.

Tell me, in the US, around what frequencies are most pager trasmitter transmitting?

Source record: 283838

I think folks arn't realizing that the modern-day commercial radios are pretty doggone wideband themselves. Most of the Motorola and Bendix-King land mobile radios I've used have been synthesized and will do 140-174, or 440-512MHz, and suffer NO intermod problems. My Icom IC-U16 will do 430-490MHz and has never gotten one iota of intermod, even when using an external mag-mount (Rx CTCSS was NOT on).

My Alinco DJ-580T, which is a great radio in my opinion, does get a bit of paging when near a few towers. Mostly 2m intermod, but then we don't have much in the way of UHF high power stuff around town.

So what's up with this? It's not that it's impossible to make a wideband HT that has good intermod rejection, it's just apparently expensive, or at least a bit bulky. I've also never seen a dual-band land mobile HT (I hear Yaseu makes one), so that's kinda inconvienent too... I suspect if I had cash, I'd buy two Benxi-King HTs (VHF and UHF), and hope they come out wi8th a dual band rig eventually.

In the mean time, if you're going to buy a ham HT, I guess you'll have to live with intermod. But the elimination of wide band Rx isn't necessarly the solution.

Now wouldn't this be a good idea, OK, maybe not to build the amp but to have an inspection and demonstrate how to use it before getting the high power licence.

To get an Extra you have to build the thing too...

271. Anybody still need Aland Isl. OH0?

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-18 11:15:03 UTC
From: oh3mep@lehtori.cc.tut.fi
Message-ID: <1o9ljn$q74@cc.tut.fi>
Source record: 283843

Hello DXers!
Our local group of 5 hams is going to have another holiday in
Aland Islands, OH0-land. This is the same group that was there
just after christmas. Last time we made little over 5000 qsos
in spite of the bad conditions, operating mostly WARC and some
activity in low-bands.
Also this time all operators will be using their own call:

OH0LQK -op. Pertti, 10m ssb + some slow cw on old bands
OH0NLP -op. Jukka, all bands cw&ssb
OH0MEP -op. Pete, all bands cw&ssb, mostly WARCs & 20m RTTY
OH0MFP -op. Alpo, 10m ssb + 15m RTTY
OH0MYD -op. Marko, 80m+40m+15m+10m cw only
and perhaps
OH0/OH3NE on 6m, Jukka or Pete operating (if we can find equipments).

All qsls to homecalls in OH3-land. If You prefer direct qslling, all
cards ok via BOX 179, 33101 Tampere, Finland, EUROPE. (You can include
all Your cards for any of us on same envelope) or also ok via cba.

We are not yet sure about all our systems, but at least we are having:
- Butternut gp for 80/75m , 40m and 30m
- 3 el monobander yagi for 10m
- 3 el monobander yagi for 15m
- Dipole for 160m
- 3 el monobander yagi for 12m or 17m (I have both elements, but one boom)
- Cushcraft R-5 gp
- one linear (2*3-500Z tubes)
- 2* Icom IC-735
- 2* Kenwood TS-440S
- PK-232 for RTTY / Amtor
- several mast-tubes 6-10m high

We will be landing there on 3rd of april and stay until 10th-12th depending
on the situation there. Our location this time will be on the easternmost
island, BRANDO (IOTA EU-02), but not the same cottage where I was last august,
so We don't yet know the exact situation there...

We are only having holiday there, our huge amount of stuff is only because
the propagation is going to be not so good, and we are just trying to be
able to get at least some qsos. Unfortunately we are not able to operate
many bands on the same time, while some of us is operating, others are
just building new antennas (or drinking beer...).

If someone needs Aland on any bands/modes we are willing to make skeds to
help You. Just drop me a mail and ask if Your time/freg is ok!

Cu all on bands!
pete

273. STS-55 SAREX Mission

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-18 11:38:12 UTC
From: abfhb@stdvax.DNET.NASA.GOV
Message-ID: <9303181138.AA16484@east.gsfc.nasa.gov>
Source record: 283844

SB SAREX@AMSAT $STS-55-002
STS-55 SAREX Mission

With only a few days before launch, the SAREX team is preparing for what promises to be the first of several SAREX flights planned for 1993.

The STS-55 Space Shuttle Columbia mission is currently scheduled to be launched into a 28.5 degree orbit on Sunday March 21 at 14:52 UTC. A 2.5 hour launch window is planned. The STS-55 mission, designated SL-D2 (Spacelab Deutsche-2), represents the second in a series of dedicated flights for Germany. The primary goals of the mission are to perform studies in materials and life science research. A 9 day flight is planned.

The seven person crew on STS-55 includes ham radio operators Steve Nagel, N5RAW, Jerry Ross, N5SCW, Charlie Precourt, KB5YSQ, Hans Schlegel, DG1KIH and Ulrich Walter, DG1KIM. SAREX operations planned on this flight includes 2-meter voice and packet. The primary voice callsign will be N5RAW. The packet radio callsign is W5RRR-1.

The 2-meter FM voice and packet downlinks for the SAREX station are on 145.55 MHz.

Uplinks are: Voice Packet

Europe 144.80 144.49
144.75
144.70

Rest of World 144.99 144.49
144.97
144.95
144.93
144.91

Note: The crew will not favor any specific voice uplink frequency, so your ability to communicate with SAREX will be the "luck of the draw."

For all operations, Earth stations should listen to the downlink frequency and transmit only when the Shuttle is in range and the astronauts are on the air. Listen for any instructions from the astronauts as to specific uplink frequencies in use during the current pass. Also, listen to

the uplink frequencies before transmitting to avoid
interference to other users.

In addition to the U.S. SAREX ham gear in the Shuttle mid-
deck, an additional ham radio station will be flown in the
German spacelab module. This station, designated SAFEX (for
Spacelab Amateurfunk-Experiment), includes a 2-meter FM
downlink and a 70-cm FM uplink capability. A dual band (2-
meter/70-cm) external antenna, mounted on the German spacelab
module, will be used for SAFEX contacts. Payload Specialists
Schlegel and Walter expect to make a few scheduled contacts
with European schools with this equipment.

The externally mounted SAFEX antenna gives the SAREX team an
opportunity to compare the performance of the U.S. SAREX
window mounted antenna to an externally mounted antenna. A
special A/B antenna test is planned on orbits 61 and 62 using
the normal SAREX downlink frequency, 145.55 MHz. During
orbit 61 the crew will transmit using the SAREX window
antenna and on orbit 62 the crew will use the SAFEX external
antenna. Individuals in the Southeastern U.S. are welcome to
help participate in this test by taking signal strength
readings of the received signal for both orbit passes. If
the shuttle is well above your horizon (>10 degrees) for both
passes, see page 42 of the February, 1993 QST to learn more
details.

Good Grief! I think that we all agree that both 1 and 3 are odd
numbers. I also think that most of us agree that 3 time 1/4 is 3/4. So
that definitely make 3/4 an odd mutilpe of 1/4. I invite you to explain
what a half-wave multiple of 1/4 is; my first guess might be something
like 3/8.

I just purchased an Icom IC-2SRA. It has a 2 meter tranceiver and a
wideband (50-950 MHz) receiver. I've not been a scanning enthusiast, but
thought I'd give it a try. Intermod is not a serious problem around here.
At least I'm not aware of it (maybe I'll be enlightened). I don't know

the precise characteristics of the front end, but know that there is a seperate bandpass filter for the tranceiver. In fact, it's seperate everything up to the audio portion, I think. It's in a cute little package, has 30/60 normal memories for the xcvr/rcvr, plus upper and lower scan boundary memories each. I've been happy with it for the first 5 days.

Clark, maybe this is the radio for you. There's also the IC-4SRA which is the IC2-SRA with a 440 instead of 2 meter tranceiver (is that IC2-SRA - 130 cm?)

Message-ID: <"18-Mar-93..9:49:56.CST".*.Mike_Beezley.houstoncssc@Xerox.com>
Source record: 283854

Haver any of you had any experience operating your mobile gear in a Chev Lumina? My next Co. car is going to be a Lumina and I have heard the body panels are mostly plastic. This concerns me. I have a 2M/70cm mobile and an HTX-100 10M mobile. I currently use a trunk-lip mount antenna. Since the Lumina is mostly plastic that kinda puts a crimp into using that antenna. I have had bad experiences using mag-mounts on Chev paint jobs and want to avoid going through that again. Are the trunk lids in fact plastic and will I have to go to an antenna that does not require a groundplane? Is the Lumina more susceptible to RF messing up its microprocessors? I want to put the 10M rig in the car to work some 10M this summer and need to start figuring something out. So, if any of you currently drive Luminas and work mobile let me know your experiences.

Thanks & 73

Warning -- don't put normal dish soap in your dishwasher to get around
this problem with dishwashing detergent!!! Normal dish soap forms
bubbles. An old trick for finding the leak in a dishwasher door seal
is to squirt a bit of dish soap in and cycle -- the bubbles come out
wherever the hole is. This works even if there isn't a hole. :-)

(In other words, you'll get to mop your kitchen floor.)

Actually, to me it sounds like someone running a repeater inverted (and probably with CTCSS) in order to avoid CATV leakage from cable channel E. I have a friend who has a repeater with the output on 145.25 (-600). In a lot of places in Northern NJ and a couple in Southern NY the cable takes out the repeater completely. Assuming that the repeater is far enough away from the nearest CATV cable to avoid de-sense, running inverted is a good way to get use out of our frequencies when the CATV operators prove to be un-cooperative. Of course, you can imagine what all those transmitters do to cable reception as they drive by the viewers houses cause cables leak both ways!! :-)

Of course, I'm just speculating.

Wow! I havent' thought of that in *decades*! SuperMarionation!
Fireball XL-5, SuperCar, Gerry & Sylvia Anderson, shlocko
special effects... it was great, I *loved* those shows when I was
a kid. I don't remember off hand what "F.A.B." (spelled out letter
by letter, not pronounced as the word "Fab") meant, but in a similar
Gerry & Sylvia puppet spectacular, the pilots said "S.I.G.", meaning
"Spectrum Is Green", a snazzy version of "Roger". No doubt "F.A.B."
meant something equally significant. Cheers...

> "dB gain" is supposed to be over a theoretical antenna called
> an "isotropic radiator."

dB gain is referenced to "SOME" antenna and you have to know what that
is. While isotropic radiator is probably the "purist" idea of a base
line, gain numbers that hams frequently use are with respect to freespace dipoles. The gain over an isotrophic radiator is frequently denoted dBi.

There's a 2.1 db difference between the two (the dipole has a 2.1 dBi gain).

We're not limiting it to SSB, bring your AM/FM/PM/CW/PULSE or other vintage radio, regardless of mode! Come one come all! The net *usually* conducts it's sessions via SSB because that's the limitation placed on Novice & Tech+ Ops, but for BOAT ANCHOR NITE, we'll wave that! Besides, 99% of the ops have the other modes - they just can't *transmit* using them! ;-)

288. Manuals Wanted for Kenwood Twins (R-599A & T-599A)

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-18 17:58:48 UTC
From: wx4d@cbnewsm.cb.att.com
Message-ID: <1993Mar18.175848.6266@cbnewsm.cb.att.com>
Source record: 283864
Cross-posted to: rec.radio.amateur.misc,rec.radio.swap

Hi All,

My neighbor, who is studying for his Novice ticket, recently purchased a set of Kenwood twins, the T-599A and R-599A. The rigs appear to be in fine shape, but came with no manuals. He would really like to find owner's manuals for the gear, perhaps also service manuals.

If you have one or more of these that you'd be willing to part with, Ernie (my neighbor) would be interested in purchasing them. Otherwise, maybe we could pay for photocopying ?

Thanks in advance !

289. TS-820 vs. TS-820S: Differences ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-18 18:06:03 UTC
From: wx4d@cbnewsm.cb.att.com
Message-ID: <1993Mar18.180603.6718@cbnewsm.cb.att.com>
Source record: 283877

Can anyone summarize the differences between the Kenwood TS-820 and TS-820S ? I have heard that the '820 had no digital frequency display, but that they were otherwise the same. Is this correct? (I know that there was an optional kit to add the digital display). If not, what other differences were there ?

My rig has "TS-820" on the front panel and rear nameplate, but it does include a digital frequency display. Is it really a TS-820, or an early TS-820S ?

Thanks & 73,

> and they don't know what your voice sounds like...

As an AF-MARS frequency monitor (gestapo assistant), there are
techniques to get a tight frequency measurement if both staions
have the goodies to cooperate. Normally, you just tune to the
assigned frequency (carrier) accurately. When there, with a
little parctice, you (I) can tell when a voice is not "normal".
One of the other responders mentioned the harmonics being off.
That is probably at least part of what the brain picks up. There
is no way anybody can tell if someone is within 10 Hz. by ear, but
when you get to about 50 Hz. you can tell rather well. K9ALD/AFA3WG

291. Icom IC-255A -- Info Wanted

Source record: 283867

Hi All,

Having recently acquired a new (old!) Icom IC-255A 2-meter mobile,
I'd like to tap the experience base out there and learn what I can
about it. I'm looking for any mods for this radio, and/or tips for
externally controlling it. The only info I'm aware of is a QST article
from May of 1982 about interfacing it to the computer.

I am also in search of a service manual. Anyone have one available
for sale or loan (to copy) ?

Any known "bugs" with this rig ? Any experiences, good or bad,
are welcome info.

Thanks in advance !

I'm getting ready to go take my first Ham exam this Saturday. I haven't purchased any study guides, partly because at $20 each, this can be quite a bit when I am trying to pass off more than one licence level. (I am quite confident that I can pass off novice--I am trying to bone up on the next few levels. I am in field goal range of 13 wpm CW.)

I have been studying the question pools. I would use a copy of one of the study guides if I had one. (I would prefer that.)

I wonder if any of you could help with the following questions:

Can anyone give a list of which exam elements are required for which license levels?

Is there a file anywhere listing the frequency spectrum alloted to the different license levels? How do the rest of you go about memorizing all this data for the exam? (This feels like a history exam where you have to memorize lots of dates & etc. --- only here it is alot of numbers for frequency allocations.)

Can you offer any other tips on getting ready to take the exam?

In answering a question on the net about how to double the frequency
of a crystal oscillator, Gary Coffman says:

< Better would be to use a Colpitts oscillator followed
< by a push pull doubler stage. This will be strong and clean as well as
< offering buffering to the oscillator.

Sorry, old man, but a push-pull circuit CANCELS even order harmonics! Push-
pull works fine to tripple, but to double you want a PUSH-PUSH circuit.

The handbook had an exmple of a push-push doubler in it for years, and it is
still in the 1992 edition. I designed that circuit into a piece of Collins
equipment many years ago to double the 10 MHz output of a rubidium
frequency standard--it works fine. If you use a reasonably high-Q tank, the
doubled output is very clean, with almost no trace of the fundamental.

Oh, dear. I didn't get in on the first round of this use of 75 ohm cable question. But in reading the summary, I didn't see mention of a cute trick I saw in the RSGB VHF manual: getting a 1/4-wave section of line of Z=sqrt(Z1*Z2) can be difficult sometimes, but you surely have some line of each of the two impedances you wish to transform between. If you arrange sections of the right lengths, you can do it as

Z1-line short-section-of-Z2 short-section-of-Z1 Z2-line

Look up the reference for details about lengths. I recall about 0.18 wavelengths for each of the short sections, for 50 ohm to 75 ohm matching.

I also didn't notice mention that a matching section which is built with a tapered impedance (e.g., tapered center conductor or even two or more short sections of in-between impedance line) is much more broadband than a simple 1/4-wave section.

303. Re: Q values.

Source record: 283508

dadams@cray.com (David Adams) writes:

>Could someone explain what a Q value is, pertaining to a tank circuit?

Though I've seen two replies here, I thought perhaps neither really
answered this clearly.

A tuned circuit - tank - is used to store energy. A tank with no
losses could store energy for an infinite length of time. The energy
"sloshes back and forth" between the magnetic field of the inductor
and the electric field of the capacitor: voltage and current.

If the current flows through any series resistance, or if the voltage
appears across any parallel resistance, energy is lost. The Q is the
ratio of energy stored to energy lost per cycle, times 2 pi. So the
more losses, the lower the Q. No losses makes for infinite Q. But
no losses also means that all the energy must be at exactly the
resonant frequency of the tank; the bandwidth is infinitely narrow.

The parts you use to build the tank will have losses, so the tank
"just sitting there" has a finite Q. Typically this will be between
100 and 1000 for HF and VHF tanks. But if all the losses were in
the tank circuit itself, then it wouldn't be very useful for much
besides a space heater. So, you typically put an additional load--
a "loss" as far as the tank is concerned-- on it. For example, you
might connect a transmission line off to an antenna to a transmitter
tank. You arrange it so _most_ of the "loss" is power sent to the
antenna, and that drops the Q. If the ratio of bare tank Q to
fully loaded Q is 10:1, then 1/10 the power will be dissipated in
the tank losses and 9/10 in the load (eg, radiated by the antenna
if it's a lossless antenna -- another topic ;-).

If you have to worry about losses in the tank components, why mess
with a tank at all? Well, it can be a convenient way to transform
from the antenna impedance to the appropriate load impedance for the
transmitter output, and it provides some rejection of unwanted
signals like harmonics of the transmitter frequency. The higher the
Q (loaded Q), the better the rejection of signals off the resonant
frequency of the tank. However, the higher the loaded Q, the more
touchy the tuning: if anything changes (due to temperature instabilities,
or operator-changed frequencies), you may have to retune. So there
are several factors affecting what Q is "optimum" for a tank.

>Also I thought I knew how to calculate the resonant frequency of a
>tank circuit given the inductance and capacitance, but I missed
>the question on the exam, so perhaps someone could address that.

>How does the answer change if the capacitor and inductor are
>in series rather than in parallel?

It's possible to give different definitions for resonant frequency: the frequency of maximum (magnitude) response, the frequency of zero phase shift, the frequency at which the inductive and capacitive reactances are the same ... These all collapse to the same answer as the Q increases to infinity, but are different from eachother otherwise. C and L in series or in parallel can only be differentiated from eachother if there are other parts in the circuit: if it's just L and C, then parallel and series are identical. If there is an explicit loss element (resistance) in the circuit, it causes a Q lower than infinity. Is it a series R or a parallel R? The lower the series R, the higher the Q; the _higher_ the parallel R, the higher the Q.

This leaves some things unexplained, but at this point, I think pictures in a book would be better than words...

>75 ohm matching.

So my memory isn't so good (two sure signs of getting old: a failing memory, and I can't remember the other one... ;-). It's 0.081 wavelengths for the 50 <---> 75 ohm transformation, and in general,

cot^2(theta) = 1 + Z1/Z2 + Z2/Z1

where theta is the length of each short sections. If you're working in degrees, divide theta by 360 to get number of wavelengths (taking into account the propagation velocity of each line). Again, this is from the RSGB VHF-UHF manual.

305. What should DTMF deviation be set to?

Newsgroup: rec.radio.amateur.misc
Date: 1993-03-30 20:24:49 UTC
From: richw@hplsla.hp.com
Message-ID: <20360138@hplsla.hp.com>
Source record: 283504

I was listening to a conversation on a local repeater yesterday which raised some questions in my mind. A guy had an HT which tested out with a DTMF deviation of around 4.5 KHz. The local expert claimed that some of our local systems (on the Evergreen intertie) wouldn't decode properly at much above 2 KHz deviation, and that 1.5 KHz was a good setting. However, most HTs seem to be set significantly hotter than this.

So, the questions are:

1. Is there a spec somewhere as to what the DTMF deviation should be on 2 meters?
2. What is the range recognized by typical commercial repeaters?
3. How does the real world (with multipath, for example) affect this whole issue; that is, in the presence of multipath, is more or less deviation better?

Note that I haven't asked about twist. I'm assuming that would complicate matters significantly...

Just to clarify terms (or confuse the issue if I'm wrong...), I am assuming that when we talk about deviation, we're talking about 1/2 of the peak-to-peak deviation of the carrier caused by the combination of the two tones.

Greetings!

I see that you are interested in a simple direct conversion receiver
and a possible transmitter companion. Well, I have built a simple DC
tranceiver in the past and had LOTS of fun with it using 100mW output
on 80 meters using a dipole at 35 feet.
I was able to make about 8 qso's out of every ten attempted and usually
had 5x9 reports over 500 mile paths.
Wes Hayward was sufficiently interested in the project that he volunteered
to help me write an article for it in QST (see Nov 1968 QST). You
should be able to build such a unit for $15 and learn a lot while doing
it too.

If you want any help, let me know.

73,

Dick Bingham W7WKR

307. Re: Crystal Catalog

Newsgroup: rec.radio.amateur.misc

richard@alaska.et.byu.edu (Richard B. Christensen) writes:
>Are there any crystal catalogs out there?

Yes. Contact International Crystal Manufacturing in Oklahoma
or JAN Crystals in Florida. I believe each has a 1-800 number.
Others probably have catalogs as well. International's is more
like separate flyers for each frequency range.

308. Re: RFD: rec.radio.amateur reorganization [discussion summary 3/31]

Newsgroup: rec.radio.amateur.misc

Ian Kluft, in <efB803hDceof00@amdahl.uts.amdahl.com>, states that there is support for the proposed reorganization of rec.radio.amateur, then presents a tally whose numbers show that a majority of those participating in the discussion did not favor the proposal. This is invidious.

I do not support any reorganization of rec.radio.amateur at this time. Proposals made to date offer movement without meaningful progress. The substantive underlying problem is one of aggregate news volume, and while there are effective solutions to that, they are untenable.

ZCZC AE42
QST de W1AW
DX Bulletin 16 ARLD016
From ARRL Headquarters
Newington CT April 2, 1993
To all radio amateurs

SB DX ARL ARLD016
ARLD016 DX news

Thanks to Bob, W5KNE; QRZ DX; Mariano, LU4EJ; and the Radio Club Del Sur, LW3DSR, for the items in this week's bulletin.

UGANDA, 5X. Bruno, 5X1A, and Jim, 5X1B, have been very active over the past week. 5X1A requests cards be sent directly to Box 3316, Kampala, Uganda. DO NOT QSL via DL0MAR. Cards for 5X1B go to Jim H. Brandenburg, American Embassy Kampala, Department of State, Washington, DC 20521 USA.

And that's not all. Paul, WF5T, and James, N3JCL, will be operating as 5X1XB and 5X1XA, respectively, from April 27 through May 12. They will be active on CW, SSB and RTTY. QSL SSB contacts via N3JCL and CW/RTTY QSOs via WF5T.

GHANA, 9G. The Dutch DAGOE Foundation operation is now active signing 9G1AA. Look for their CW on 1832, 3505, 7005, 10105, 14020, 18075, 21020, 24900 and 28020 kHz. For SSB, check 1840, 3645/3775/3795, 7045/7080, 14195, 18125, 21295, 24940 and 28395 kHz. Read their RTTY on 14090, 21090 and 28090 kHz. The group will listen for USA stations on 75 and 40 meters on 3800/3810 and 7175/7200 kHz. QSL to Wim Faasen, PA2FAS, Weeskinderendijk 81, 3314 CM Dordrecht, The Netherlands.

SOUTHERN SUDAN, ST0. A deteriorating situation here may end up in separate independent republics. A conference is planned for sometime in April or May to work out the details of the transition. John, PA3CXC, will be monitoring the situation and will be active again on all bands if his work schedule permits.

ALAND ISLANDS, OH0. A group of Finnish operators will activate Brando Island (IOTA EU-002) from April 3 through 10. The ops on this effort are Pete, OH3NE as OH0/OH3NE; Pertti, OH3LQK as OH0LQK; Jukka, OH3NLP as OH0NLP; Pete, OH3MEP as OH0MEP; Alpo, OH3MFP as OH0MFP; and Marko, OH3MYD as OH0MYD. QSL via each operator's home call sign or to Box 179, 33101 Tampere, Finland, with cards for

different operators in the same envelope.

AN ELITE GROUP GAINS A NEW MEMBER. Congrats to SM7BAE for qualifying for Two Meter DXCC Number 3.

AN IOTA FIRST. Members of the Radio Club Del Sur will be signing L1DSR from Bermejo Island, IOTA SA-021, from April 2 through 4. This will be the first time this island has been activated by radio amateurs. For CW, check 10 kHz up from the band edge. For SSB, try 3690, 7090, 14190, 21290, 28590 and 50110 kHz. There may be some 6 meter CW work and FM on 29000 kHz.

THIS WEEKEND ON THE RADIO. The annual Spring QRP ARCI CW QSO Party is on from 1200z April 3 through 2400z April 4. You owe it to yourself to give this contest a try with the gain way down.

The SP DX Contest, CW, runs from 1500z April 3 through 2300z April 4. Check 160, 80, 40, 20, 15 and 10 meters for this one.

The kick off for the ARRL VHF/UHF Spring Sprints is Monday night, April 5, from 7 to 11pm local time on 144 MHz.

More information on all three activities can be found on page 110 of March 1993 QST. See you in the test.

From: tomb@hplsla.hp.com
Message-ID: <20360142@hplsla.hp.com>
Source record: 283507

dstock@hpqmoca.sqf.hp.com (David Stockton) writes:

> I was originally taught that the best definition of Q was
>
>
> Q = the ratio of the stored energy in a resonating system to the
>energy lost, per cycle, by that system.

Hats off to David for posting the most useful definition of Q, IMHO,
in terms of real understanding. However, a small nit: multiply the
above by 2pi, or state it as energy lost per radian.

> This version leads to all the old familiar versions but neatly
>sidesteps parallel or series lossy elements, and whether the loss is
>into bona-fide resistance or into imaginary term of dielectric constant,
>or even radiated.

And no longer even depends on the "circuit" being electrical: Quartz
resonators certainly have Q values, as do pendulums, cavities, tubs filled
with water, violin strings, flutes, tuning forks, ... But a flywheel
doesn't (at least not _as_ a flywheel) because it's not a resonating system.
(But a flywheel and a torsion spring, like in a mechanical watch, does.)
Note that some resonators have more than one possible mode of resonance;
each can have its own Q (e.g., the Q of the fundamental of a quartz
crystal, or the Q of the third overtone, etc.)

Cheers,
Tom

311. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-02 21:43:03 UTC
From: tkelso@afit.af.mil
Message-ID: <rec-radio-info733868075@ve6mgs.ampr.ab.ca>
Source record: 283735
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (also updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293

Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc,rec.radio.info

Good morning. It's Sunday the 4th of April and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- 18MHz-band intruders have been removed by RSGB; there are two new RSGB committee chairmen; and we have urgent news for Top band ARDF enthusiasts.

The RSGB's Monitoring System, otherwise known as the Intruder Watch, has had four recent successes which have been of benefit to all radio amateurs. An Argentinian fax, naval data and two diplomatic stations have been removed from the 18MHz band with the assistance of the Radiocommunications Agency. Brief details of the role of the Monitoring System can be found on page 78 of the RSGB Call Book and a fuller description is in the December 1992 edition of Radio Communication. The Coordinator of this RSGB service is David Owen, G0OES.

The RSGB Microwave Committee has a new chairman. He is Steve Davies, G4KNZ. The previous Chairman, Mike Dixon, G3PFR, become the Microwave Manager. The RSGB Planning Advisory Committee also has a new chairman. He is Geoff Bond, G4GJB. Details of the Society's other office-holders can be found in the April edition of RadCom.

The RSGB'93 Show takes place on Sunday the 16th of May at the National Exhibition Centre, near Birmingham. There will be the usual trade stands in a single huge hall, plus a large display of the work of RSGB Headquarters and of the Society's committees. The National Vintage Communications Fair is also being held that day in the NEC complex. Many visitors will wish to visit both shows and reduced rates are available for this.

Next details of two ARDF event which, unfortunately have not appeared in Radio Communication. The Top Band Amateur Radio Direction Finding contest for the Geoff Peck Memorial Trophy take place today Sunday the 4th at Cowleaze Wood, Stokenchurch, at NGR 727 958. Competitors need Map 165, Aylesbury and Leighton Buzzard. Competitors should assemble at 13.00 for a 13.20 start. The next Top Band ARDF is the Slade Qualifying Event which is scheduled for Sunday the 18th of April. The venue is the Industrial Estate, 2 kilometres East of Bridgenorth at NGR 739 927 found on Map 138, Kidderminster and Wyre Forest. Competitors should assemble at 13.00, to start at 13.20. Competitors requiring tea should notify John Drakeley on 021 772 2278 (work) or 021 770 3474 (home), no later than Sunday the 11th of April.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.
From Ghana, the Dutch DAGOE Team will use the callsign 9G1AA from now until

Saturday the 10th of April. Check these frequencies: for CW 1832, 3505, 7005, 10105, 14020, 18075, 21020, 24900, 28020kHz and for SSB 1840, 3645, 3775, 3795, 7045, 7080, 14195, 18125, 21295, 24940, 28395kHz, RTTY 14090, 21090, 28090kHz From Liberia, F6FYD holds the call sign EL2YD and will be intermittently on the air until the end of 1993. From Liechtenstein, HB9BCK will be active as HB0/HB9BCK from Sunday the 11th until Saturday the 17th of April. From Kampuchea, F1MXQ will be active as XU5SE from now until mid-June. From Paraguay, the Radio Club Paraguayo will use the callsign ZP3AA to activate the rare ZP3 call area from Thursday the 8th to Saturday the 10th of April. Activity will be on all bands using CW and SSB. From the Maldives, DL1ZBE will be active from Ziyaraifushi Island from Sunday the 11th, until the 2nd of May on the 20, 15 and 10 metres bands, running barefoot to a ground plane antenna. DL9WVM will be active from Baros Island from Wednesday the 7th to Wednesday the 21st. The callsigns are not known at the time of going to press. From Aaland Island, a group of OH3 operators will be active from now until Monday the 12th of April. OH0LQK will be active on 10 metres SSB and slow CW on all bands, except the WARC bands. OH0NLP will be active on all bands using CW and SSB. OH0MEP will be active on all bands using CW and SSB, and especially the WARC bands, plus 20 metre RTTY. OH0MFP will be active on 10 metres SSB and 15 metres RTTY. Finally OH0MYD will be active on 10, 15, 40 and 80 metres using CW only. OH0/OH3NE may be aired on 6 metres.

Rally news now, and we know of two events for today, Sunday the 4th.

The Launceston Amateur Radio Rally is being held at the Launceston College in Cornwall. Doors open at 10.30am. There are the usual traders, a large bring & buy stall in two large halls. Hot snacks and refreshments are available and talk-in is on channel S22.

The White Rose Amateur Radio Society Radio Rally is being held at the Allerton High School, Kings Lane, Leeds 17. Doors open at 11.00am. 10.15am for disabled visitors. There are the usual trade stands, an RSGB stand and a bring & buy stall. Refreshments are available.

We know of no scheduled event for the Easter Weekend, Friday the 9th to Monday the 12th.

Contest news next:

The first of the RSGB Slow CW Cumulative Contests is tomorrow, Monday the 5th, from 1830 to 2000GMT, using 3.530 to 3.580MHz only. See March RadCom, page 81 for the rules which emphasise the importance of sending slowly during the event. The RSGB's first 1296/2320MHz Fixed Contest will take place on Sunday the 11th of April from 1600 to 2200GMT. See February's RadCom page 66 for the rules.

Special event Station GB2RN, operated by the Royal Naval Amateur Radio Society will be aired during Easter week. Activity starts on Saturday the 10th of April, and runs through to Sunday the 18th. Station is operated from the Bridge Wireless Office on HMS Belfast, located in the Upper Pool of London, between London and Tower Bridge. Check these frequencies: 1.970, 3.660, 3.740, 7.090, 14.190, 21.360 and 29.933MHz, CW and SSB as appropriate. Operation will also be on 2 metres FM and SSB. The local Packet Bulletin board will be

GB7HSN, accessed on 2 metres.

Time to get your diaries out as we have news of the eighth AMSAT-UK Annual Colloquium which will be held from the 29th of July to the 1st of August at the usual venue, the University of Surrey. Anyone wishing to present a paper should submit an abstract no later than the 1st of May to: Doug Loughmiller G0SYX, Colloquium Programme Chairman, Centre for Satellite Engineering Research, University of Surrey, Guildford GU2 5XH. Booking forms for visitors to the Colloquium will be available from the 15th May. Requests for forms and any enquiries should go to: Ron Broadbent, Hon Sec AMSAT-UK, London E12 5EQ, enclosing a large self-addressed, stamped envelope.

And now the solar factual data

For the period 22nd to 28th March, magnetic storms seriously affected northern latitudes but were declining by the end of the period. Only one flare of any note was reported, an M2.3/SF on the 23rd. Otherwise only small B and C flares were reported. Sunspot counts have meaned about the 67s and solar flux levels have averaged 121 units hardly changing day to day. The geomagnetic Ap index was up to full storm levels of 47 units on the 24th, about K7, due to a mag storm starting at 21.55 hours on the 23rd, and though levels declined it remained unsettled up to the end of the period. The Ap average for the period was 23.2 units. The state has been mag storm at northern latitudes and 'Strat warm in final stage'. The radio quality indices have declined with the magnetic storm and were down to very poor on the 24th. The Stavanger circuits were almost useless, with Moscow and New York being only slightly better. Due to a mistake the aa indices were sent out for the wrong period, so are not to hand this week. The X-ray flux has been very low and averaged only B2.3, though the 24th was down to only B1.9. Levels were recovering as this bulletin was being prepared. Bartells rotation started on the second of April.

Now the ionospheric data for Central France:

Not all the data is to hand but the F2 daytime critical frequencies at Poitiers, as reported by Meudon, have declined considerably and averaged only about 8.4MHz. On the 24th it was only 6.1MHz due to the magnetic storm. The darkness hour lows were not affected so much, being about 3.0MHz. There has been periods of spread-F most days.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg have declined. The daily highs averaged 8.2MHz and the darkness hour lows 3.2MHz. Solar cycle 22 is still giving us surprises, after month 77 it is recording the second highest mean level of solar flux, surpassed only by the highest cycle ever recorded, cycle 19. It is also higher than the mean level of all passed cycles at this time since solar flux has been measured.

And lastly the solar forecast:

This week, the most active side of the sun will be rotating away. Solar flux levels are expected to be about the 150s. Geomagnetic activity is expected to be unsettled due to the passage of coronal holes, and on the basis of history

the radio quality indices are expected to be normal. MUFs are expected to reach 30MHz during the day on north/south circuits. Darkness hours are expected to reach about 18MHz. And that's the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T J and G7 O T series, and Novice calls in the 2 0 A E and 2 1 B P series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

314. HAM-server INFO file

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-03 17:26:46 UTC
From: KA6ETB@GRAFex.Cupertino.CA.US
Message-ID: <gate.BZPF2B1w165w@grafex.Cupertino.CA.US>
Source record: 283733
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,sbay.hams

```
All you might ever want to know about the KA6ETB HAM-server

Hardware:
========

386/25 PC clone
Telebit QBlazer modem
10-Meg file space reserverd for archive

Software:
========

Waffle 1.65
WFSmail 2.03

General Information:
===================

Orders for files are filled between the hours of 0100-0600 daily. This is so
those hosts through which the traffic is forwarded are not overloaded. Since
we all depend on the generosity of others to carry the mail, it behooves us
not to make them angry.

ASCII (text) files are split at about 30,000 bytes or 700 lines (which ever
comes first). UUENCODED binary files are split at about 750 lines.

If you are using a PC and you do not have UUDECODE, follow these steps:

1. Order UUDECODE.BAS or UUDECODE.C, and UUEXE515.ZIP.
2. Compile UUDECODE.BAS or UUDECODE.C on your system.
3. Use the resulting executable to UUDECODE UUEXE515.ZIP. UUEXE515 has
documentation about UUENCODE/UUDECODE.

You are all set to start ordering binary files from HAM-server.

/hamradio/newfiles/ contains files that have not yet been categorized.

If you order a file and do not get it, check the index to be sure you have
spelled the file name correctly. If you have ordered the file correctly,
then order a new INDEX, as I may have moved the file to a different
directory. The system is still expanding, and I am trying to keep it in
managable chunks.

A new INDEX is automatically generated every Sunday.

New files are being added and old files are being changed and updated.
You might want to send a order for NEWFILES <date> from time to time,
to see what's new. <date> has the form of MM-DD-YY and is required.
```

Ordering Information:
====================

Send an email to:

HAM-server@GRAFex.Cupertino.CA.US

In the text of the message, place:

HELP
INDEX
GET /hamradio/00-INDEX.TXT

HELP will send you the HAM-server HELP file. This is processed immediately
for return delivery.

INDEX will send you an index of the files and the directory they are in.
00-INDEX.TXT is a description of most of the files in INDEX. This file
is in a continual state of flux, therefore many of the file names listed
therein may not match INDEX, but you can figure it out.

Some Reasons Why Ordered Files Are Not Received:
==

1. Your return path is incorrect. My bounce mailbox fills up quite
regularly with messages. And, since the path is incorrect, I cannot
contact you to let you know.

2. You have spelled the file name incorrectly. Use the file names
listed in the INDEX, rather than 00-INDEX.TXT. The later is only a
guide.

3. The file name has changed since the INDEX was generated. Order a
new INDEX.

4. Your order was sent to KA6ETB@GRAFex.Cupertino.CA.US, instead of
HAM-server@GRAFex.Cupertino.CA.US. File requests sent to me
will not be honored (naturally).

--EOF

315. Language and History (Was: Re: ARRL living in the past?)

In <1993Apr1.225218.21618@pixar.com>, Bruce Perens writes:

>It's the language that I find the most offensive. I found it embarassing
>to explain to my non-ham fiance' that XYL meant "Ex-Young-Woman", and
>was used to refer to any married woman. The ARRL perpetuates this usage
>in QST, which is one reason I think they are living in the past.
>To say this is OK is like saying it's OK to call a Black person a
>"nigger".

"XYL" is a putatively clever euphemism for "Old Lady," silly. The intent of this telegrapher's abbreviation, when it entered currency, was to be comparatively _inoffensive_. Today, this distinction appears to be lost on many.

Is it a bad thing to perpetuate a usage in a culture that is increasingly unknowledgeable of its history and indisposed to examine and assess its antecedents? This is paradoxical.

How is this different from listening to the frequency long enough to hear someone else give his callsign, and counting that? I'm certain that goes on more often than anyone thinks.

I'll just throw one observation into the fray:

Unfortunately, there are some CW ops who habitually send their own
callsign in a quirky way (wrong rhythm, much too fast, or something)
even though the rest of their sending is easy to copy.

319. Rec.radio.reorg won't work, anyway.

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-04 18:59:46 UTC
From: emd@ham.almanac.bc.ca
Message-ID: <BaXH2B1w164w@ham.almanac.bc.ca>
Source record: 283744
Cross-posted to: news.groups,rec.radio.amateur.misc

Many of the proponents for the reorganization of the rec.radio newsgroups have complained about the volume of news postings on r.r.a.m. By my count, r.r.a.m. is usually less than 100 articles per day. An active group, certainly, but not overwhelming, to be sure.

(And we could certainly reduce it even more if certain people would stop @#$%^& CROSSPOSTING their bulletins! :-)

Given our experience with rec.radio.policy, which by any criteria has been a dismal failure at moving policy discussions off of r.r.a.m., however, why are those of you proposing the split confident that more newsgroups will work?

All that will occur is that EVERYBODY will cross-post to a r.r.a.m. as well as the specific group. All that you've done is to duplicate the original postings in the new groups. If you don't believe me, fine. Go and look at r.r.policy and see how many articles were ONLY posted to policy. Find any?

While I'm in favour of reducing the traffic volume, I'm not in favour of adding, wholus bolus, a great whack of new newsgroups that will only duplicate traffic even further.

As far as I'm concerned, the new proposal is not wanted, not needed, and not likely to result in any improvement.

Robert Smits There is *no* idiotproof filter.

VK2WI Weekly News Bulletin

for

4th April 1993

THE MAJOR NEWS ITEMS THIS WEEK
Silent Key
NTAC to be Re-formed
New Shuttle Launch This Week
Aliens from Outer Space Catch Eavesdroppers
"Titanic" Special Event Station
Fox Hunting on TV

SILENT KEY

We start the bulletin this week with news of a Silent Key.
We've been advised that Harry Cuthbert VK2AEC passed away at
Nerandra on the 16th March.

Harry was a well-known and active member in the Southwest
Zone, during the 60s and 70s, when annual field days were
held during the October long weeken. When it was the turn
of Harry's region, he organised what was perhaps one of the
best.

Harry will be missed by all Amateurs who had the pleasure to
meet him.

Vale Harry Cuthbert VK2AEC.

-- Tim Mills VK2ZTM

DIVISIONAL NEWS

The VK2 Divisional AGM has been put back to Sunday, 9th May.
Please note the new date in your diary; the date shown in
the March issue of "Amateur Radio" magazine is now
incorrect.

The VK2RWI Packet Bulletin Board is now back on air, running
the F6FBB packet system, which will provide many features
that the users have asked for in recent months.

-- Steve VK2QZ, Co-Sysop VK2RWI

NTAC TO BE RE-FORMED

The New South Wales Division Technical Advisory Committee (NTAC) was disbanded at the Council meeting of the 26th March, and is to be re-formed. The Committee is primarily responsible for prcessing repeater and beacon applications before they go to DoTC.

The Divisional Council has appointed an interim committee, comprising Bob Mayer VK2BMU, Cesar Miranda VK2TCM, and John Simon VK2XGJ from the Illawarra region. The committee will re-form NTAC, its operations, and procedures, and will report back to the Divisional Council this Friday. In the meantime, the committee has continued to process repeater and applications.

-- Bob VK2YEL, Divisional Secretary

The April issue of "Amateur Radio" magazine will arrive soon, and it will include the New South Wales Division's Annual Report and your membership card. Please read the report and come to the AGM or send a proxy. Ballot papers for your Divisional Councillors will arrive in a separate posting. This year you have choice of 12 candidates, from whom you must pick nine to represent you for the next year.

NEW MEMBERS

The following were recently accepted as members of the WIA:

Nigel Cupitt VK2KJU
David Shaw VK2TIP
John Telek VK2XTB, and
Michael Warner

Please join us in welcoming these new members to the oldest division of the oldest Amateur Radio Society in the World.

The Divisional Bookshop will be open at both days of the Urunga Radio Convention next weekend, and Maragaret Morris at the Parramatta office advises that some additional stocks of the 1993 Australian Radio Amateur Callbook are available.

AMATEURS IN THE NEWS

We'd like to thank Derek VK5AFP, who sent us the article "Banding together in defence of radio hams" from The Weekly Telegraph. The article tells of the Radio Society of Great Britain's efforts to counter the recent "Amateurs are Eavesdroppers" media coverage.

Although written in a rather tongue-in-cheek fashion, with lines like: "hams are 100% kosher", and referring to Tony

Hancocks famous "Radio Ham" sketch of the 1950s, the article does highlight some of the positive aspects of Amateur Radio.

Don't forget that you can make your own good publicity for Amateur Radio. Why not write to your local, regional, or national newspaper and tell them how all the astronauts on this week's Space Shuttle mission are Radio Amateurs?

On the TV, Andrew VK3KIR tells us that Channel 9's Wide World of Sports will feature Amateur Radio Fox Hunting. The item was due to go to air this weekend, but has been delayed a week. So look out for the foxes this coming weekend, 10th or 11th April. For more updates, you can contact Andrew via the "JKARC" telephone BBS, on (03) 521 1206.

NEW SHUTTLE LAUNCH THIS WEEK

With the "Columbia" grounded for a couple of weeks, we turn our attention to STS-56, the Space Shuttle "Discovery", which is due for launch on the Tuesday 6th April at 0532 UTC, or 4:32pm AEST. For only the second time in NASA history, ALL crew members on board are licensed radio amateurs. The usual SAREX frequencies will be in use, and we ask you to avoid transmitting on the SAREX downlink frequency of 145.550 MHz.

The STS-55 mission, which was scrubbed last week just three seconds before liftoff, has been tentatively rescheduled for launch on 23rd April. STS-57 will probably be launched sometime between the 10th and 18th May.

ALIENS FROM OUTER SPACE CATCH EAVESDROPPERS

(No, this is not a joke, nor a late April fool item!)

The Usenet "Risks" Digest (volume 14, issue 44), carries news of this story in the London Times of the 23rd March:

[quote:]

Officers in Warrington Cheshire, fed up with people listening in to their messages, broadcast that a flying saucer had crash-landed in a field & gave details of where to find it.

Radio messages about a huge glowing spacecraft were broadcast with the warning "Do not approach. It may be radioactive." The warning was followed by directions to the field in Appleton. The eavesdroppers arrived within minutes, expecting to see little green men. They were arrested instead.

Police said that 5 people had been reported to the Crown Prosecution Service for telecommunications offences. Scanning devices that can pick up police radio messages are widely available but using them to listen to police transmissions is an offence.

[end quote]

It's not known if any of the arrested parties were licensed Radio Amateurs. :-)

"TITANIC" SPECIAL EVENT STATION

Ian Griggs VK2WR will again be operating a special event station, in memory of the "Titanic" disaster of 1912.

From the 10th to 15th April, the callsigns VK2CQD and VK2MGY will be heard at various times to suit propagation.

"CQD" was the initial distress signal used by the "Titanic", until Captain Smith suggested to Marconi operator Phillips that he try the new "SOS", as it might be his last chance to do so!

"MGY" was the official radio callsign of the "Titanic".

VK2MGY will be heard around 3.620 and 21.181 MHz, while VK2CQD can be worked on 14.181, 14.281, or the Southern Cross DX Net on 14.236 MHz. Morse will also be used at the low ends of both the novice and unrestricted bands, with the appropriate callsign.

A new commemorative QSL card will be available to all contacts in the usual ways.

-- Ian Griggs VK2WR

PACKET OPERATORS DIRECTORY UPDATE

Last week, we reported that Matt VK2XIL was compiling a directory of Australian packet radio operators. Matt has been in touch with us to clarify a few of the issues.

To get in the directory, please send the following basic details to VK2XIL at VK2RWI:

your callsign
your first name
the POSTCODE only of your address
any node callsigns heard at your location
the frequency you use most
your local bulletin boards and frequencies
your local ROSE node and frequencies
your TCP/IP address if you have one

If you want, you can also send your hardware/software configuration.

Some people have expressed concern that equipment and addresses would be published; Matt says that no such details will be published. The equipment info is to help Matt research an article an article about Packet Radio.

So far, 70 operators on the list; to increase that number, send your details to Matt VK2XIL at VK2RWI.

-- Matt VK2XIL

WICEN NEWS

Today, WICEN has been providing radio communications for the 1993 Big NSW Bike Ride and the Forster Triathlon, Australia's largest Triathlon. Thanks to all Amateurs who have been helping in these events.

The WICEN (NSW) Executive Committee meets on 17th April, WICEN Sydney South meets on the 20th. WICEN Sydney North's AGM will be on the 21st at Ku-ring-gai SES, and volunteers for all committee positions are sought.

On Anzac Day 25th April, Hunter WICEN will be providing communications for the Newcastle Anzac Day Parade.

Looking ahead, the annual Goulburn Conference is on the weekend of 15-16th May, and all WICEN personnel (not just coordinators) are invited to attend. Also on the same weekend is a Car Rally in the Central Coast area, and Dave VK2UDT is looking for volunteers.

A Disaster Management Course is on the weekend of 22nd-23rd May, for which Barry VK2AAB is taking applications. More news on these events will be given in future broadcasts.

WICEN is always looking for new members to provide the community with communications assistance when required. Write to WICEN (NSW) Inc, PO Box 123, St Leonards 2065; or come up on the regular Sydney WICEN net, on Thursday nights at 9.30pm on repeater 7150.

-- Dave VK2KFU, WICEN (NSW) Publicity Officer

IPS WEEKLY REPORT

26 March - 1 April 1993

Issue no.: 14
Date of issue: 2 April 1993

Date 26 27 28 29 30 31 01
10cm flux 117 123 126 129 129 125 124
A index 06 09 12 14 15 09 (08 est.)

T index 77 100 109 75 101 39 92

Summary of activity

Solar activity was low from the 26th to 28th March, moderate on the 29th and 30th, and again low on the 31st March and 1st April. There was an M1 flare on 29th, and an M2 flare on the 30th.

The geomagnetic field at Learmonth (WA) was quiet or quiet to unsettled, except for a brief active period on 30th March.

Ionospheric F2 critical frequencies at Sydney were mostly near predicted values, with daily enhanced periods of up to 40 per cent until late in the UTC day on the 30th March. Overnight, frequencies were depressed by up to 30 per cent, then returned to near predicted values to the end of the period.

Forecast for the next week (2 - 8 April)

Solar: Low to moderate.

Geomagnetic: Quiet to unsettled with active to possible minor storm levels on the 5th and 6th.

Ionospheric: Near predicted April values with depressions to 40 per cent on the 5th and 6th.

CLUB NEWS

Last week, the AUSTRALIAN AMATEUR TELEVISION CLUB and the GLADESVILLE AMATEUR RADIO CLUB combined to present a most successful test through VK2RFM, the AATC ATV repeater. The repeater had just undergone major adjustments and this was its first test.

Gladesville Television, on Wednesday evening, transmitted into VK2RFM, from a 70 cm. transmitter under test, a distance of 70 kilometres and received back at the studio in Lane Cove a P4 picture on 24 cm. The quality of the return picture was excellent, (almost noise-free), considering the distance involved - a round trip of 140 km.

With the success of this test, the club can look forward to doing more tests with a view to getting the ATV signal to Wollongong.

The Gladesville Amateur Radio Club and the Australian Amateur Television Club have thus shown how cooperation between clubs can improve the hobby for all amateurs.

Gladesville thanks the AATC for their assistance in this test, and appreciates the time and effort put in by their club members to keep this project ongoing.

-- Pat VK2JPA for the Gladesville Amateur Radio Club

Today's meeting of the AUSTRALIAN AMATEUR TELEVISION CLUB at Amateur Radio House, will be a real treat for satellite TV enthusiasts. A demonstration of how to set up and receive microwave TV signals from Aussat and Intelsat will be given by Guest Speaker of Gary Cratt. The meeting starts at 1pm, at Amateur Radio House, 109 Wigram Street Parramatta.

For more information about the club, write to PO Box 494, Liverpool 2170, or phone 671-4832 after hours.

-- Mark VK2GFR

The CASTLE HILL AMATEUR RADIO CLUB meets on the first Wednesday of each month, at the home of Ian O'Toole VK2ZIO, 222 Old Northern Road, Castle Hill, at 8 pm. The next meeting is on this Wednesday evening. At the March AGM, new office-bearers were elected.

New members and anquiries are always welcome. Club meetings are friendly and informal, and are held in the rooms of the Castle Hill Military Radio Museum. Supper is provided, and there is a nominal fee to cover expenses.

Next month, Ian Jensen VK2AQJ will give a talk on early spark transmitters and other gear of this period, and will be demonstrating some of his working replicas. For more info, ring 634-1462 after hours, or 634-7210 most hours.

-- Ian Griggs VK2WR

The next meeting of the ST GEORGE AMATEUR RADIO SOCIETY will be held at the usual venue, that is in the 1st Allawah Scout hall, corner of Bellevue Parade and Blakesley Road, South Hurstville, at 7.30 pm this Wednesday.

No guest speaker has been arranged for this month, so it will be an excellent opportunity to have a ragchew with fellow members and visitors.

Visitors are always welcome to club meetings, coffee, tea and biscuits are provided and the members look forward to meeting those interested in attending.

-- Allan VK2XF Publicity Officer

The 44th annual URUNGA RADIO CONVENTION will be held this coming weekend, the 10th and 11th April in the Senior Citizens Centre, Urunga. The venue is very comfortable, wit heasy access and a lounge and all conveniences attached. Continuous free tea, coffee, and biscuits will be available.

The convention features the finest foxhunting timetable in Australia. Indeed, the foxes were both bred locally for the purpose.

A variety of goods will be for sale, competitions and quizzes are open to all who attend, and a presentation of trophies and prizes will be presented on Sunday afternoon.

Urunga is a village near the mouth of the Bellinger River, on the far north coast of New South Wales. The climate is ideal for a holiday with the family, with daily temperatures between 21 and 24 degrees C.

Your family and friends are welcome to attend the convention, or they can take advantage of the recreational opportunities of the area, such as boating, fishing, swimming, bowls, golf, or sightseeing.

For more information about the oldest continuous radio convention in Australia, you can contact the Urunga Radio Convention Committee: VK2ZCQ, VK2DGT, VK2ADA, or VK2DMS.

-- Merv VK2DMS

Last Wednesday, the WAVERLEY AMATEUR RADIO SOCIETY paid a visit to the Signal Station at South Head for a very interesting and informative visit. The view from up there is spectacular to say the least.

The Australian Volunteer Coast Guard, which runs the station since taking it over from the Maritime Services Board a year ago, is doing a fine job but they are also looking to get more operators for the radio side. If you are interested in becoming involved in this you could contact them via the club, by writing to PO Box 131 Watsons Bay 2030, or phone Eric VK2KUR on (02) 337-2909 or the Signal Station direct on (02) 337-5033.

The next meeting of the club will be this Wednesday, 7th April at the Clarrie Martin Community Centre, 61 Newland Street, Bondi Junction commencing at 8pm. The guest lecturer for this meeting is a friend of Rick VK2QU who will be talking about his trip in Africa.

-- Eric VK2KUR

BROADCAST ROSTER

Next Sunday morning: Peter VK2BPN and Peter VK2JPJ
Next Sunday evening: Tony VK2ZLT and Kevin VK2CKD

The divisional office is open from 11am to 2pm, Monday to Friday, and 7 to 9pm Wednesday nights. The phone is answered from 12 noon to 1pm during the day, and you can leave a message on the answering machine outside these hours.

News highlights are also available on the divisional voice mailbox on (02) 552-5188, and you can leave a message afterwards if you wish.

Items for inclusion in this bulletin may be sent by mail to Post Office Box 1066, Parramatta 2124; by fax on (02) 633-1525, or by packet radio to "VK2WI at VK2RWI", to reach us by 7pm on the Friday prior to the broadcast.

Hi Charlie,

The reason we don't have third party agreements with
European countries is because their telecommunications
organizations have monopolies on their telephone systems
and such. The policy of the State Department is that
the US will be glad to enter into a third party agreement with
any country, but that particular country must first
approach the US with its intentions. Typically, the US benefits more
from the presence of such an agreement due to the large numbers of
amateurs in this country. 73.

Hmmm. Several rigs available in my youth had 11 meters built in, but when I was first licensed (1956) I couldn't afford to buy anything, so I built a rig that was xtal controlled for Novice CW. No 11 meters there, but when I struggled into a General Ticket, the band was still a ham band, the fabulous sunspot cycle was on the upswing, and 11 meters was a gold mine for a kid running low power CW. It was open nearly around the clock and had great DX on it... I was amazed when I read the rules about the "new" Citizens Band that was to be put where my favorite band was -- with the same kind of power limits I used... And the FCC expected this band to be a local only!?! Hah! It was a killer for DX then, and never lost the magic for me...

Yes, I made real, legal, good contacts on 11 meters when it was still a Ham Band... and the lack of use was related to other measures than your comments imply... the band was taken away and given to a low-power Citizen (small business) band...and it stayed that way until the truckers began using channel 19 for "smokey reports" and the late 70's sunspot cycle made 11 meter DXing a fun sport for those without ham tickets...

Ah, those were some good days...thanks for reminding me of what once was. I'd almost forgotten how much I missed that band.

327. AURORA WATCH: Middle Latitude Auroral Activity Watch

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-04 23:40:43 UTC
From: oler@rho.uleth.CA
Message-ID: <9304042340.AA28857@rho.uleth.ca>
Source record: 283731

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 23:00 UT, 04 APRIL

/\

VALID UNTIL: 19:00 UTC ON 07 APRIL

MODERATE RISK PERIOD: 05 - 07 APRIL (UT days)

PREDICTED ACTIVITY INDICES FOR NEXT 3 DAYS: 32, 27, 20 (05 - 07 APR)
(INPUT INTO THE PREDICTIVE AURORA SOFTWARE *)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: LOW - MODERATE

EXPECTED LUNAR INTERFERENCE: HIGH

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR TO POOR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

MOST OF THE NORTHERN U.S. STATES AND SOUTHERN CANADA FROM SOUTHERN
BRITISH COLUMBIA TO CENTRAL MONTANA TO NORTH DAKOTA DAKOTA TO
MINNESOTA TO MICHIGAN TO NORTHERN NEW YORK STATE TO SOUTHERN MAINE
AND POSSIBLY PARTS OF NEW HAMPSHIRE.

ACTIVITY MAY ALSO BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

NORTHERN U.K. TO THE NORTHERN EUROPEAN REGIONS INCLUDING MUCH OF
THE NORTHERN AND CENTRAL PARTS OF NORWAY, SWEDEN AND FINLAND, TO
NORTHERN RUSSIA. THERE IS AN OUTSIDE CHANCE SOUTHERN AUSTRALIAN
AND/OR NEW ZEALAND SITES MAY SPOT PERIODS OF ACTIVITY ON THE SOUTHERN
HORIZON, ALTHOUGH ANY ACTIVITY OBSERVED FROM THESE SITES SHOULD BE
DIFFUSE AND MOSTLY INACTIVE EXCEPT FOR A FEW POSSIBLE RAYS.

* Contact: Oler@Rho.Uleth.CA or COler@Solar.Stanford.Edu for more information
regarding the Auroral Activity Prediction and Simulation Software.

SYNOPSIS...

An interplanetary disturbance that arrived at 14:34 UTC on 04 April has
enhanced levels of auroral activity. However, the phase of the moon is
substantially limiting the observability of this activity, even though
it appears to be moderately energetic. Upper middle latitude regions
are expected to be able to spot most of the activity. Lunar
interference will hamper attempts to view activity from the central or
lower middle latitude regions. This disturbance is expected to last

approximately 24 to 36 hours before beginning to subside.

This WATCH will remain active until 19:00 UT on 07 April when it will either be updated or allowed to expire.

** End of Watch **

> Department of Astronomy, University of Texas,

Derek, once again I was about to make essentially your post, when I
saw you had already made it :-).

To those who answered Steve's original question, remember it was in
the context of a DXpedition - not a 20m ragchew. I have also sat in
various pileups for a rare one who was going at a very sloppy 35-40 WPM -
sloppy enough that (to use the above example) the call would change from
NF6S/KP1 to NF6H/KP1 to NFBH/KPJ (you get the idea). What do you do?
Walk away because the DX isn't Mr.(Ms.) Perfect?

Steve made his best effort to copy the call, and asking for a fill is
nothing to get hot over. If you were sitting in such a pileup, having
trouble copying the call, and the DX showed up as a packet spot, complete
with call, wouldn't you use (and they at least try to verify) the information?

Of course, put this in a different context - a contest - where you may have
copied DL3B?? and you listen a few minutes and can't get it, but there are
1000 other QSO's waiting for you - you strike it from the log. Period.

Sheesh.

While we're at it, how about taking an ad for the National Man Boy Love Association? (NAMBLA) Assuming of course, that they profess an interest in Amateur Radio. What better way for older men to meet young boys than through a national magazine with the targeted coverage of QST?

Do not point at the Jewish amateur radio organization and use their ad as a justification for inclusion of Lambda in the advertising policy of QST. Unless you happen to be Nazi left over from WWII, or perhaps one of the more rabid middle eastern groups, the Jewish organization does not espouse as controversial a "life style" that those of the Lambda group choose to pursue.

The ARRL is dedicated to Amateur Radio. Groups like such as the Jewish organization and the Quarter Century Wireless Association get mention in QST because their primary focus is Amateur radio. If the homosexuals want to form a group specifically for amateur radio, then they too will eventually grace the pages of QST.

When will the whiners figure it out that they really can have a life of their own without having to constantly draw attention to their personal choices? Which group will be the next to attack the ARRL for not showing them their support? Vietnam veterans? Disgruntled postal workers? Children of ex-prostitutes?

333. ALERT: Minor Geomagnetic Storm Alert

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 03:41:09 UTC
From: oler@rho.uleth.CA
Message-ID: <9304050341.AA02346@rho.uleth.ca>
Source record: 283740

/\

MINOR GEOMAGNETIC STORM ALERT

ISSUED: 03:15 UT, 05 APRIL

/\

ATTENTION:

Geomagnetic activity has surpassed the minor storm threshold at 03:00
UTC on 05 April following a sudden storm commencement (SSC) at 14:34 UTC on
04 April. Minor to major storming followed the arrival of the SSC. Similar
minor to major storming is expected for the next 24 to 36 hours before giving
way to stabler conditions. High latitudes may observe brief periods of
severe storming during the local night hours.

The GOES-6 and GOES-7 spacecraft experienced fairly important
magnetopause crossings of approximately 2 hours.

HF propagation conditions have become increasingly degraded as the
disturbance has matured. Poor to very poor propagation is expected over the
high and polar latitudes for the next 24 to 48 hours. Middle latitudes are
expected to see mostly fair to poor propagation during the night sectors and
good to fair propagation during the daylight hours. Low latitudes should be
less affected with mostly good propagation throughout the period. Greater
improvements are expected over all regions on 07 and 08 April.

This disturbance appears to be the result of a well placed extension of
the southern polar coronal hole.

** End of Alert **

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 05:00 UT, 05 APRIL

/\

VALID UNTIL: 19:00 UTC ON 05 APRIL

HIGH RISK PERIOD: 05 Apr - 06 Apr (UT days)
MODERATE RISK PERIOD: 05 Apr - 07 Apr

PREDICTED ACTIVITY INDICES FOR NEXT 3 DAYS: 50, 35, 20 (05 - 07 APR)
(INPUT INTO THE PREDICTIVE AURORA SOFTWARE *)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE

POTENTIAL LUNAR INTERFERENCE: HIGH

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

AURORAL ACTIVITY _MAY_ BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

SOUTHERN WASHINGTON TO CENTRAL OR SOUTHERN IDAHO TO SOUTHERN MONTANA
TO SOUTH DAKOTA TO SOUTHERN MINNESOTA TO WISCONSIN TO MICHIGAN TO
PARTS OF NEW YORK STATE TO NEW JERSEY.

THE U.K., AND NORTHERN PARTS OF EUROPE INCLUDING ALL OF NORWAY,
SWEDEN, AND FINLAND, INTO NORTHERN RUSSIA MAY ALSO SPOT ACTIVITY.

AREAS OF SOUTHERN AUSTRALIA AND SOUTHERN NEW ZEALAND MAY ALSO BE
ABLE TO SPOT PERIODS OF ACTIVITY.

* Contact: Oler@Rho.Uleth.CA or COler@Solar.Stanford.Edu for more information
regarding the Auroral Activity Prediction and Simulation Software.

SYNOPSIS...

Auroral activity has intensified and is now visible over the northern
tier of the U.S. states. Conditions are expected to remain favorable
for observing periods of auroral activity over the middle latitudes for
the next 24 to 36 hours. Lunar interference will hamper attempts to
view activity and will drown out a substantial amount of detail.
Nevertheless, this may be a good opportunity for some over the middle
latitudes to observe activity. Dark sky sites are essential given the
magnitude of lunar interference which exists.

This warning will remain active until 19:00 UT on 07 April when it
will either be updated or allowed to expire.

** End of Warning **

>
>Jeff
>--

Jeff, sorry to tell ya, but if you were to try that on a dx net, or
if the guys at DXCC knew, wrong, you wouldnt get credit for the contact.
For a valid contact, you HAVE to receive the guys callsign. Ok, to u
i send a 599 but i dont know who ab6mb is, but i know who kc6skv is.
So what, i had to look it up on the callbook, and that is'nt right.
A valid contact is more then just a 599. He could have been /KP anything
How can u copy the /KP1 and not the call if you listened for hours?
You have got to have at least a valid exchange, RR ab6mb ur 599 de xxxx/kp1.
rr xxxx/kp1 tu 599 de ab6mb. If you didnt get it, ur cll agn pse de ab6mb.

Count it if you want, but if someone has to tell you the callsign, your
cheatin, and you just as soon make up a whole slew of calls and send them
in, because hey, who cares, its the honor system right?

Think about it, did you get his call on the air, or over Usenet? Is that
a valid contact?

Charlie

340. OPDX Bulletin #106 - April 5, 1993

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 05:51:07 UTC
From: reisert@mast.enet.dec.com
Message-ID: <opdx.106@ampr.org>
Source record: 283793
Cross-posted to: rec.radio.info,rec.radio.amateur.misc

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 106
BID: $OPDX.106
April 5, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DF4RD, IS0JMA, OH2BN, N2US, W3YQ, KB8WC, K4CEF & Southeastern Cluster Group, K6OZL, NW8F, KF8VW, K8YSE and VE3BW for the following DX information.

4W, YEMEN. It seems that the rumor OPDX reported a couple weeks ago about a possible 4W1UA operation is true. Pete, K6EDV, reported on a DX net that RW4WR, UA4WAE, UA9MA, UA4WII, possibily ZL1AMO and others, and himself will be active the first week of October. Pete mentioned the group has the licence in hand.

5A, LIBYA. There were some 5A0RS7 and 5A5A spots showing up on the cluster network, but the feeling is they were the work of SLIMS.

8R1K AND EA8BH QSL CARDS. Martti Lane, OH2BH, will not be at Dayton this year due to his planned dxpedition to Spratly (1S). He advised that there is a new automated mail system in Finland now and envelopes that do not conform to the standard European size require more than US $1 postage. Martti has about 800 envelopes for the USA that OH2BGD will be bringing to the US at Dayton Hamvention time. These envelopes will be stamped and mailed in the USA. If you have not received your 8R1K or EA8BH card, be patient. And remember, when sending to Finland in the future, use a European size envelope or include extra postage. SPECIAL ADDED NOTE: Congratulations to Martti's son who is now OH2KNB!

9F, ERITREA. DJ9ZB and friends will be operating as 9F2DX sometime next week (maybe around April 9th). QSL via DJ9ZB.

9G, GHANA. The Dutch operators continue to be active signing 9G1AA. It was reported that they will be there until April 11. Activity has been on: CW - 1832, 3505, 7005, 10105, 14020, 18075, 21020, 24900 and 28020 kHz. SSB - 1840, 3645/3775/3795, 7045/7080, 14195, 18125, 21295, 24940 and 28395 kHz. RTTY - 14090, 21090 and 28090 kHz. The Dutch opertors listen for USA stations on 75 and 40 meters on 3800/3810 and 7175/7200 kHz. QSL to Wim Faasen, PA2FAS, Weeskinderendijk 81, 3314 CM Dordrecht, The Netherlands.

A5, BHUTAN. It was reported that a A51JM was working Europe on 20 meters CW, April 2. There are not very many details about this station.

BV, TAIWAN. Joe, N4MQX, will be portable BV/N4MQX from April 9-20. He will be active on 80-10 meters with a possibility of some 6 meter activity.

ET, ETHIOPIA. Timo, OH5MVT, was reported active as ET3TI. His length of stay is unknown at this time, but he was heard on 7004 kHz at 2130z.

FR/T, TROMELIN. Henri, FR5ZQ, will be signing FR5ZQ/T for one month. W2/F2YS is trying to hold a sked on 14256 kHz at 0200z, but he has not been able to raise him on the frequency as of yet. Keep listening.

J5, GUINEA-BISSAU. There is a new "YL" now operating from here and her call is J52AK. Mark, J5UAI, is working on her antenna system. A stateside manager may be in the works for this station. Stay tuned for more details.

MARCONI MEMORIAL STATION. Roberto, IS0JMA, informs OPDX that on April 23rd, 24th and 25th, station IY0GA will be active from Cape Figari - Golfo Aranci - (SS) Sardinia Island, Italy. IY0GA is among the 23 Marconi stations in the world that will be participating with the "Cornish Radio Amateur Club (Cornwall U.K)" during the International Marconi Day April 24th. Operations will be on HF-VHF-UHF and all modes. It was on August 11, 1932, when Gugliemo Marconi carried out a microwave test connecting the lighthouse of Cape Figari (Mt. 340) with Rocca di Papa (Rome). QSL to IS0JMA, Roberto Alaimo, P.O. Box 41, 07026 Olbia (SS), Sardinia Island, Italy.

IOTA NA-139. Members of the Goddard Amateur Radio Club will be active from Assateague Island from 0000z May 1 to 1200z May 2. The call sign will be WA3NAN/3 and the frequenices will be 7185, 14260, 21260, 28460 kHz on SSB and for CW, check 25 kHz from bottom of band edge. QSL via CBA.

QSLS IN THE MAIL. P5RS7 are being received in the mail. It was reported earlier that the League would not rule on Romeo's documentation for this operation until after March 31. The 9ER1TB cards are being received. The card was reported to be a beautiful looking QSL, but Eritrea still does not count as a separate new DXCC country.

UC, BELARUS REPUBLIC. From June 20 to July 2 the Belarus Republic will be on 6 meters for the very first time. Hans, DL5BAC and Klaus, DJ9YE, received permission to operate with the help of Sergej, UC2AKP, who will also be joining their 6 meters DXpedition. They will operate from two different grid-squares in this country. After a short visit in Minsk they will travel to a small village near Gomel, where Sergej's grandmother lives. From there they will start to operate from KO42 and KO41. Their callsigns will be EV5D and EV5K in KO42, and EV5M and EV5N in KO41. They will be active on 50.095, 50.145, 50.165 and 50.215, 28.885 Mhz (6m-Net) and 14.345 Mhz (VHF-Net). Also a beacon will run on 50.077 during times of inactivity. QSL via DL5BAC

V4, NEVIS ISLAND. Members from the Northern Ohio DX Association and the Lake County Amateur Radio Association will be active from here April 29th to May 5th. Operators will be Jack/KB8WC signing V47WC, Scott/KO8O signing V47RS and Bruce/N8LXS (call sign not issued yet). Activity will be on 80-10 meters (including the WARCs) on CW and SSB. QSL all SSB contacts to KB8WC and CW contacts to N8LXS.

XQ0X, SAN FELIX. Last week we reported that John, XQ0X, was very active on CW, but the following interesting information was reported to OPDX. It seems John has been joined by Julio, CE8CWO, a naval CW operator, who has been passing out CW QSOs from time to time.

XW, LAOS. Joe, VE3BW, received a phone call from Hiro, JA2EZD, stating he will be returning to XW-land April 28 to May 8. He will be active as XW2A. QSL via CBA. Another operator will be joining him signing XW6A. QSL via JL6LLD.

YI, IRAQ. Tomasz, SP5AUC, is now active from here, but his length of stay is unknown. He was using the call YI9CW and stating to QSL via P.O. Box 11, Warsaw 93, Poland. Activity this past weekend was on 15 meters CW between 1330-1700z. There had been other reports earlier this month on 40 and 12 meters.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3 FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

>discourages you from discussing controversial issues on ham radio, but
>that's just because they're a bunch of old fogeys who don't want flame
>wars to erupt on the bands. :-)

Flame wars over who was on the frequency first, license class, who was
licensed longer, who heard the DX station first, etc. are all okay just
stay away from the touchy topics of politics and religion.

:-) :-) (for the humor-impaired)

>in QST, which is one reason I think they are living in the past.
>To say this is OK is like saying it's OK to call a Black person a
>"nigger".
>

Heavens to politically-correct Murgatroid! Can't bring yourself to say
"Ex-Young-LADY" huh? It doesn't refer to "any married woman", it refers
to specific married women, i.e. those to whom it is applied. If you
don't like it, don't use it.

In its day, the term was funny -- adding "X" to "YL" as in "that was no
lady, that was my wife." It was used as humor in place of the proper
term, "YF" for "wife." Of course, we love to judge the past in the eyes
of the present, and things that were funny once now raise the
self-righteous, self-conscious yuppoid reactions you cite.

I'm not a religious person, but It's interesting to note that the
biblical advice is that if something offend you, you pluck your own eye
out and not that if something offend you, you take action against
others. Life would be simpler (and usenet quiter) if people worried more
about their own actions and less about their neighbors'.

344. TS940 help!!!

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 11:04:58 UTC
From: penneys@pecan.cns.udel.edu
Message-ID: <1993Apr5.110458.15432@udel.edu>
Source record: 283752

I stuck a wire into pin 2 of the xverter jack of my 940 to obtain 12v to key a relay to enable an amp. The amp was not turned on. This method had worked previously.

I believe I may have shorted something out. The rig locks up in xmit-red light on, can change any function like band, mode, vfo, freq, even t-t set will indicate on panel or readout. Mike or key will generate signal. Only thing is, rig will not revert to receive.

Rig is apart and Q29 on control board has been replaced. Maybe a diode or two? Any ideas? All switches have been checked numerous times, etc.

Tnx Bob WN3K FRC

345. 9K2ZZ's manager - W8CNL still?

I'll be the attempting the West Buttress route on Denali, aka Mt. McKinley, in Alaska, this May. I bought a 2M HT just for the occasion. Would anyone happen to know repeater frequencies for the Talkeetna and Kantishna Alaska areas?

TIA.

350. Re: Worked him????/DXing practices

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 13:59:47 UTC
From: waco@cbnewse.cb.att.com
Message-ID: <1993Apr5.135947.7958@cbnewse.cb.att.com>
Source record: 283759

In regard to this thread on working a station without copying the call sign, I have a pet peeve in DXing. How often do you hear a QSO that sounds something like this? (Using my own call for illustrative purposes, I don't do this.) However, I am not without guilt. When I run across a pileup, I listen to try to determine who the DX is. Often, a DX station seems to never send a call. So, to be sure. I will work the station without using the DX's call (not necessary anyway, unfortunately) and hang around the frequency until I find out who the station is.

DX: QRZ

I: GERMANY JAPAN, GERMANY JAPAN, GERMANY JAPAN...

DX: THE WHISKEY GOLF STATION, YOU'RE FIVE AND NINE

FULL CALL OF ****WG: QSL THE FIVE NINE, YOU'RE ALSO FIVE NINE, QSL?

DX: QRZ

I: GERMANY JAPAN ...

DX: THE GERMANY JAPAN STATION, FIFTY NINE, QSL?

I: QSL THE FIVE NINE; YOU'R ALSO FIVE NINE, FIFTY NINE. WHAT'S YOUR CALL? CAN YOU REPEAT YOUR CALL AND QSL MANAGER?

DX: QRZ

I: WHO IS THIS GUY? WHERE'S HE AT? WHAT'S HIS CALL? (Never answered by others on frequency as they are trying to work the DX, not answer questions from some nerd QRMing the frequency with stupid questions.

The only thing worse than giving 59 (599) reports when you don't even know who you are working is the DXpeditions that have their QSL cards preprinted with signal reports of 59 or 599 (Yes, I have some). However, i dislike what appears to be a standard net practice: This is net control -- please don't use the other station's call, he/she knows who he/she is, just use his/her first name. Coming across a net like this one hears:

Margaret -- this is *****, you're 59, 59, QSL?

***** QSL the 59, youre also 59.

Pedro -- this is ##### your 33, 3 by 3, QSL?

QSL the 3 by 3, you're also 3 by 3, 3 by 3, QSL?

etc.

Problem here is a person just coming on frequency doesn't have much of an idea who Margaret or Pedro or the others are, so they insist on asking just when the weakest DX station is giving someone a report. I think a good idea is to ALWAYS call the DX using the DX station's call; this practice seems to result in a much more orderly pileup with more stations getting through with less QRM.

Many hams dislike DX nets, or nets of any kind, but you're most likely to hear REAL signal reports exchanged on a net than the "typical" DXpedition (the whole world is 59, right?). Hey, if I hadn't been on the YL ISSB's net a few years ago at the right time, I wouldn't have JY25's (JY1's special picture QSL card celebrating his 25th year as monarch) on the wall.

Time now to step off the soap box.

After several weeks of variable response, garfield.catt.ncsu.edu is again on line. It appears that someone reorganized things over this past weekend.

Garfield has a collection of Ham software and mods. Some of the mods show up in two different directories: one in Ham Mods and one in Scanners. These mods appear to duplicate the ones that appear at other sites. There just haven't been any new mods lately!

>prostitutes?

Jeff,

You are an ignorant person. Don't fear, however. This can be cured.
What 'ignorance' means is that you lack enough information to have an
opinion of merit in a particular area. In this case it is homosexuality.

You see, we've (all of us) been fed mis-information on a whole
array of things, ever since birth. But some of us have bridged that
information gap and have first hand knowledge on this particular subject,
homosexuality. I'm here to share some of that knowledge with you, and
hopefully provide some 'perspective enchancing' excercises for you.

Whether you are promoted from your ignorance, or then display
the trait of 'stupidity' (the lack of ABILITY to obtain knowledge and
therefore overcome ignorance) is yet to be discovered.

Now, you imply that among people who practice homosexuality there
are 'whiners' who feel the need to 'constantly draw attention to their
personal choices'. Surely you can easily see the failure in that observation
to include heterosexualy identified people, can you not? I have constantly
heard of marriages, romances lost and won, families, etc... What of this
'constant draw of attention' ??? Surely you were just not thinking when
you came to the conclusion that homosexualy identified people are doing
something here that heterosexuality identified people are not.

As a matter of fact, Queer/Gay/Lesbian/Bisexual/transgendered people
have, as a group of sorts, come to a relevation that this land was made for
you AND me. As such, we are 'coming out of the closet' in ever larger numbers
and claiming our places in society as whole persons. We demand the same
enfranchisement in society due to any other contributing members. Chiefly
of concern in this context is our right and our need to identify ourselves
and thus find a community of like minded people, at least to endorse ourselves
and our yearning for love, acceptance, and fulfillment.

Unfortunately, people like yourself, hanging onto a passe world view
of opportunity based on value-less attributes (such as gender, race, class,
etc) have a need to believe their misinformed assumptions at least to protect

the status quo. It would be a harsh awakening to find that you must compete with everyone on realistic terms. You need to see groups of 'others' who do not deserve the same appointments as you, or the same venues for expression.

Do you see? Is any of this piercing your veil of ignorance? Or will you deny it all?

Homosexualy identified people are as a group losing their ignorance regarding these issues, and making themselves known for what they are, and claiming their rightful place in history, and contemporary society. It is up to you to determine whether or not you will move forward and honor humanity or whether you will cling blindly to a moral/ethical code which is neither.

At any rate, we ARE here, and we ARE Queer, and we've got RADIOS!

> 73 es GA from Jeff

Bruce-

Although it doesn't quite fit your stated requirement, Radio Shack sells 14 guage, 7 strand bare copper antenna wire, in 70 foot lengths for $5.99. They have insulators as well. Wire should also be available from the Ham stores such as Amateur Electronic Supply. The AES catalog lists 14 gauge stranded Belden antenna wire at $16.95 for 100 feet, or $149.95 for 1000 feet.

Although it is quite un-flexible, the strongest wire is solid, and is called "copper clad". This is a steel-core wire with a copper coating. The main advantage of this, is that it doesn't stretch like copper. If a limb were to fall on it, the supporting wire or an insulator might break, but the copper-clad probably wouldn't (depending on the guage). I think I recall seeing enamel-insulated copper-clad many years ago, but it may no longer be made.

At one time, copper-clad could be purchased at a lower price from farm supply stores, as "electric fence wire". However, I think galvanized wire is what is currently available. If there is such a store nearby, you may want to check.

I have been following this thread with mild amusement and its fairly obvious that the majority of views are missing the real point. If the DX is out there and you want to work it you have to work on his terms - if this includes waitingfor 45 minutes for the DX to I.D. then so be it. If the DX is sending 45 wpm then so be it. Usually the DX is trying to cope with a pile and if by using anti social techniques it helps him - not us - then so be it.

I know its remarkably difficult for a nation of 'fast food freaks' to even contemplate waiting for anything on this planet let alone some guy on a coral reef up to his ass in alligators & mosquitos sending his call when we say he should but really chaps lets see some *patience* and tolerance of the DXers position.

And thats the bottom line.

I imagine "filling in the blanks" has been going on, to some extent, since there have been 3 or more hams, the DX, the guy that worked him and someone else who heard the DX. Its just that technology makes it easier, and perhaps less public.

> if it has some altitude.

Pat-

Back in the 50's when I got started, a popular antenna was called the "full Windom". It was actually not a Windom, but was an off-center-fed dipole, fed with 300 ohm twin lead. I don't recall the dimensions, but it was around 135 feet long. The theory was that the chosen feedpoint had approximately 300 ohms impedance on the harmonically related bands from 80 through 10 meters, so it could be matched to 75 ohms with a 4:1 balun. The "half Windom" was just a half-size version for limited space, and worked 40-10 meters.

Back in those days, many of us didn't understand things like SWR. Many rigs of that time had a Pi-Network output circuit, and could accomodate quite a range of load impedance. Therefore, an error in feedpoint impedance usually went unnoticed.

Note: A true "Windom" antenna isn't a dipole. It is a single wire, fed off-center with a random length of wire to a tuner. You don't hear much about Windom antennas. I suspect they are of historical significance only.

From: baxter@kuhub.cc.ukans.edu
Message-ID: <1993Apr5.090711.48829@kuhub.cc.ukans.edu>
Source record: 283778

I'm looking at the new Kenwood TM-742A dual bander, and have some conflicting information, that others here on the net may be able to help with.

I've been told by others that this new dual bander is capable of having both bands tuned to 2-meters or both tuned to 440 (like the 732A). I spent some time looking through the reference manual at one of our local ham stores this weekend, and I could find nothing that says this is possible.

Is it or isn't it?

For those that own the radio, are there any other undocumented features, or goodies like the 741A had?

Thanks,
Kirk Baxter, N0FPZ

>issue until then.

The problem is that we have a classic example of two worlds clashing here:
Itsa Flat, no, itsa round! :-)

I may hazard a guess that the listserver has more of an effect on the
outcome of this discussion than any other group split (since, for
example, rec.aviation didn't have a massive listserver (Duno ?)).

I think the solution is to create a multitude of lists, one for each
group, and only allow the *first* group in the list to select which
listserver (except, rec.radio.info, which I have tried to ensure that
it is the last group in the list ...) the article is sent to. There
may be a need for a mailing address like:
rec.radio.amateur.digital.misc+rec.radio.amateur.space@ucsd.edu
(UGGHHH, rrsdm+rras@ucsd.edu? to allow a discussion about the Microsats ...)
for the listserver applicants. How many of the listserver applicants
are running a local email2news gateway, and how many of them are human?

Brian's Serve ...

366. Re: Q values.

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 16:02:12 UTC
From: dstock@hpqmoca.sqf.hp.com
Message-ID: <C50pvp.F6@hpqmoea.sqf.hp.com>
Source record: 283772

It's worth looking at the tables for coupled resonator filters in "Zverev" (Handbook of filter synthesis, the original tome of modern filter theory) labelled "3dB DOWN k AND q VALUES" to confuse the uninitiated.

Zverev's tables are each normalised in several ways, you have to process his values to allow for the centre frequency, bandwidth and impedance of the filter you wish to create. Even Q is normalised. If you take the ratio of centre freq to bandwidth of the wanted filter, you have the Q value that all others are normalised to. If you measure or even estimate the unloaded Q that you could achieve in your resonator design, and divide it by the filter's normalising value, you have a factor showing (in loose language) what factor your resonators are better than the finished circuit. Zverev provides sets of values for several different values of this factor, which he calls q0. He gives filter design values which correct the shape of the filter for the effects due to not using perfect (infinite Q resonators) and he also gives the filter insertion loss, dB, to be expected. If such a filter is used in front of a low noise pre-amp, then the filter loss must be added to the noise figure of the amplifier function.

There is, naturally, a strong interest in making filters with enough rejection to eliminate overload from unwanted signals, and yet still allow good enough noise factor not to ruin an otherwise good preamp. This is a classic dilemma, if I could make my pre-amp have better big signal handling, I could use a milder filter and get the benefit of less insertion loss, hence better system noise factor.

What is not realised by many people is that the tables in Zverev, from which most modern filter books are derived, in fixing the filter shape to correct for limited resonator Q (a process called pre-distorted design) sacrifices insertion loss in order to get accurate shape. This means that if you don't pre-distort your design, and accept a poor looking shape, you can get less insertion loss for the same rejection further out.

Seymour B Cohn wrote a paper showing a way to design coupled resonator bandpass filters for minimum insertion loss rather than ideal passband flatness. There is a nice comparison of the insertion losses of the different approaches, and the passband shapes they give. Cohn's optimised filters have lumps in their responses, fairly high up the skirts.

(The paper is "Dissipation in multiple-coupled-resonator filters" Proceedings or the IRE August 1959, page 1342 to 1348)

It's heavy going to read, but the pictures tell the story :-)

Cheers
David GM4ZNX

I would tear up the card or send it back to him with "Not in Log"
if he supplied with return postage or an SASE. And yes, I have done
this.

> first time I have had the nitpickers turn their sorry guns on me. As
> I said, my card in the mail to him and all the "Sorry dudes" who made
> comments, whoops, make that those who said "Sorry dude" comments won't

> this now goes in my KILL file where I should have put it long ago.

No credible person talks about "working" someone when they haven't
even copied the callsign! This ain't nitpickin'.

And I think Charles Morrison nailed it on the head:

>Count it if you want, but if someone has to tell you the callsign, your
>cheatin, and you just as soon make up a whole slew of calls and send them
>in, because hey, who cares, its the honor system right?

It's your wall, your "accomplishment". Do whatever you want.

John, care to explain just what the hell this means?

What I make of it, and by being so terse you invite people to understand your statement on their own terms, is that you think that the subject of Gay and Lesbian Civil Rights is not worthy of concern, and that any such concern is laughable, at at the very least unwarranted? Further, it seems that you feel that the subject can only be dealt with as a nuisance topic, and not as something that affects many people in profound manners?

Is that what you mean?

Hmmm, this is a war (somewhat harsh, I know) between the people that use threaded news-readers, the people that don't, the people that want to see all things in one pot and the people that can't control what they get in the pot (listserv). Currently, *.misc is too big for some people and they are cancelling from the listserver (I get 2 requests a week from people that want to know how to cancel their subscription to the info-hams list because of too much volume, price I pay for being the r.r.info moderator, they *think* I have the answers :-) or complaining about it in the group. See the warning signs!

>P.S. If people used a threaded newreader (like trn), topics of interest could
>be followed easily, whilst others discarded, all by using the topic id and
>Shift-D.

The proposal hurts non of these groups of people (except the admin of the listserver itself ...), and helps most of them.

For *your* threaded news reader, Derrick, you will not be bombarded with new discussions in topics you have no interest in to decide if that is a thread you are interested in reading. Your argument is for a flat news system such as in A-news, been there, done it, never again!

|>
|> But I've seen these antennas used in repeater applications where there must be
|> _no_ RF on the screen.
|>
|> What am I missing ?

I assume you mean a J-pole fed like this:

```
|
|
| drawing not to scale
| |
center -+ +- shield
|__|
```

What you have to remember is that voltage potential is a relative, not an absolute value. In this case the voltage at the botton of the matching section has a potential with respect to ground. However, since the antenna has no ground connection at that spot, it does not matter. In fact, in this case the shield of the coax is the ground. What matters as far as the operation of the antenna is that there is a potential difference and an RF current flowing between the center conductor and the shield of the coax.

>
>Jeff
>--

I concur with Jeff, I often work QRP with 1W or less and if that station
had come back to me with WO7T ur 599 TU, in my log he would have gone.

Many of you may have benefited by working a DX station and having your call
copied in his log with one letter incorrect, and then received a card in
response to your card because all the associated information was correct
and he could correlate to his log and realize you were BB1HS and not BB1HH
Of course if you're a real purist then you should be sending a little note
with your card to every station you QSL:

=====================================================
| Please do not send me back a card if you do not |
| have my call listed in your log exactly as it is |
| printed on my card. If they differ at all we did |
| not have a valid QSO and I don't want your card |
| |
| Please also don't mail me your card if our dates |
| and GMT time don't match exactly. That wouldn't be |
| a valid QSO. |
=====================================================
```

Ease up a bit guys, Jeff probably just doesn't have access to a DX cluster via packet radio, and didn't know the complete call prior to working the guy.

As was suggested earlier, the associated awards and cards bring personnel satisfaction, and if he's satisfied with that contact, or contacts via nets, or contacts sited on a DX cluster it is his business, but 2-way contact was established and to deny that is unfounded.

>organization and the Quarter Century Wireless Association get mention in QST
>because their primary focus is Amateur radio. If the homosexuals want to form
>a group specifically for amateur radio, then they too will eventually grace
>the pages of QST.

What makes you think that LARC isn't specificially for amateur radio? At LARC's last meeting one member reported on how the local Office of Emergency Services plans to incorporate amateur radio into their disaster preparations; a number of other members plan to participate. We had some discussions of our next service event in May; we provide communications for the AIDS Bike-A-Thon, which raises a lot of money for HIV/AIDS research and care. Some people talked about equipment they had to trade or sell, and that was the end of the meeting. A few people stayed around to look at the hosts' setup; they have a big packet BBS system.

The ARRL Section Manager is going to speak at our next monthly meeting, and we'll probably finish talking about the Bike-A-Thon. We're getting a new repeater, so we'll probably hear more about that.

Just what part of our meetings do you think is inappropriate?

I don't know much about what the national LARC does, but I understand that they just had a DXpedition, and that they have a block of rooms at the Hamvention every year.

> When will the whiners figure it out that they really can have a life
>of their own without having to constantly draw attention to their personal
>choices?

I wish the homophobes would come up with new and original lines of attack. That same reasoning could be used against practically any group, but it's only used against gay/lesbian people.

As far as drawing attention to your personal choices goes, do you wear a wedding ring? Do you wear a cross or have a little fish symbol on your car? Do you wear a Masonic pin? Do you have a David Duke bumper sticker on your

car? All of those things draw attention to your personal choices. I'm not saying that those choices are illegitimate, just that there's a double standard.

>Which group will be the next to attack the ARRL for not showing them
>their support?

I believe that LARC is asking for recognition as a valid amateur radio group, not for "support", whatever that means. I can't speak for LARC, of course.

>Vietnam veterans? Disgruntled postal workers? Children of ex-
>prostitutes?

This is really pretty irrelevant to the issue at hand, but if someone wants to form a group of left-handed Vietnamese war veterans who have call signs containing the letter B, why should the ARRL turn down their ads?

I reiterate, this discussion DOES NOT BELONG HERE. You sir are discussing
politics, not amateur radio. I have definite political feelings, but will
not discuss them here or on the air. It is bad form. Amateur radio is
for encouraging international goodwill. This is in contridiction to the
discussion of contriversal issues.

There are those who still believe a homosextual lifestyle is wrong. You
are advocating forcing a lifestyle on those individuals. If you want to discuss
this with me further, please post only to the radio.amateur.policy, or I
will not respond.

Good point, so .policy proves it can work

>The info group did not unload the faqs, etc. from misc. A failure in
>my opinion. :-(

This was NOT what the group was for (although, there are administrative
side effects that allow it to happen, ask your admin to enter
!rec.radio.info,rec.radio in the sys file ...) There were far too many
voices demanding that the group be a concentrator, not a a deflector
(albeit, r.r.shortwave users wanted cross-posting, r.r.a.misc users
were divided). No one, until now, suggested that the FAQs be removed
from the groups (that would be silly, think about it, where are the
new users going to be?, the experienced users can do a !r.r.info or
kill file since the FAQ posters remain the same, day-in and day-out).
The bulletins, on the other hand, a case could be made ...

>As you say yourself, the packet group is a very successful sub-group.
>I would attribute this to the narrower focus that does not support
>flame fests as well as misc does.

After (If?) the proposal goes through, you will see `take this flame-fest
to r.r.a.misc where it belongs!' :-)

>It's more like providing a good book with an index or a table of contents.

Wow, I *like* this analogy!

>If someone wants to concentrate on only one aspect of ham radio, then

379. ALERT: Storm Upgraded to a Major Category Event

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 16:46:42 UTC
From: oler@rho.uleth.CA
Message-ID: <9304051646.AA07348@rho.uleth.ca>
Source record: 283779

/\

MAJOR GEOMAGNETIC STORM ALERT

UPGRADED: 07:00 UT, 05 APRIL

/\

ATTENTION:

Geomagnetic activity surpassed the major storm threshold at 06:00 UTC on
05 April. Conditions are expected to continue at minor to major storm levels
throughout most of this UT day before beginning to subside on 06 April and
ending on 07 April. Localized brief periods of severe storming may persist
over some high latitude stations during the local night sectors.

Significant HF degradation has been observed with this strong
disturbance. Thought to be the result of a high-speed solar wind stream from
a well placed negative polarity extension of the southern solar polar coronal
crown, this disturbance has produced very poor to useless propagation over
the polar and high latitude paths. Strong degradation of middle-latitude
east-west paths has also resulted, limiting communications more to
north-south directed paths. MUFs are 25 to 50 percent below normal values.
Slow recovery of the ionosphere is expected, with the lower and middle
latitudes seeing improvements first. Conditions are not expected to return
to near-normal values until 07 and 08 April.

** End of Alert **

380. DX 'n stuff

Newsgroup: rec.radio.amateur.misc

cfm1471@ucs.usl.edu (Morrison Charles F) says:
(Subject: Re: Worked Him????)

>>Jeff, sorry to tell ya, but if you were to try that on a dx net, or
>>if the guys at DXCC knew, wrong, you wouldnt get credit for the contact.

DX nets do not set the standard for the rest of DXing.
The last time I listened to one of these net things,
the DX told the caller "you have QSB, 55 to 59", and
the W (who didn't hear a thing) said "QSL the 57?", so
the net cop says "That's within the range he gave you,
good contact". DX nets have their own rules, and you
have to play by them if you use them. Same thing with
people working freestyle.

>>You have got to have at least a valid exchange, RR ab6mb ur 599 de xxxx/kp1.
>>rr xxxx/kp1 tu 599 de ab6mb. If you didnt get it, ur cll agn pse de ab6mb.

Nonsense - you can't work many DXpeditions! I have yet to hear
a DXpedition where the operator wants to hear his call coming back
every time he works someone. It just slows everything down, and
people who go on DXpeditions do not want to be slowed down.

30 yrs ago this was indeed the case, you had to send the other
person's call every time you made a transmission, but that is
no longer true. I would say that among the last 150 countries
I worked, I didn't send the other person's call once. I know
who they are, they know who they are, I know who I am. The only
thing left is for the DX to know who I am. Once they send my call
and I send them a report that is it. Same thing in contests, you
don't send the CQer's call unless it is part of the contest exchange.

People don't go to Navassa or Burma to talk about the weather and
their health, or even to give accurate signal reports to people.
It's a different world from 2m FM conversations or casual 20m QSOs.

My sympathies are with the original poster. He was just honest
(or foolish) enough to admit to hundreds of people that he didn't
get the KP1's full call - it would have been better to ask a few
friends or read the OPDX Bulletin posted around the same time, with
the calls mentioned. This particular expedition could decide later
to send cards to everyone in their log, via the buro, and the poster
would have got his; I suppose there are people who would then send
the card back to the KP1 ops saying "Gosh, I thought it was an H
instead of an S, you'd better have this back", but I have yet to
meet one.

I did once write to a person in a Certain State asking for a sked when I needed one more state on 160m, and he simply sent me a QSL card with fake information on it because "Texas is easy to work from [Certain State]". That *is* going too far, and I made him get on the air and work me, so I do have some morals...

Good DX to all so inclined, and don't slow down the expeditions by sending their callsign every time you call 'em! If you don't get their call, keep listening, but don't do anything to slow them down. They don't care what your name is, they probably don't write down the report you give them, and they certainly aren't going to quiz everyone individually as to whether they know the DX's call sign, know how to spell Navassa, or even know what continent it's in. If you don't think those are "real contacts" - well, that's DXing for ya!

: if the guys at DXCC knew, wrong, you wouldnt get credit for the contact.

Warning: Soap box alert
Actually on a DX net the net control will give the other stations call
anyway so you know what it is already. Of course you don't have to get
through to the DX in a pileup just the net control. And of course if
you or the DX station gets the report wrong the net control will tell you
and you get to try again. Real DX huh. Fish in a barrel.

: For a valid contact, you HAVE to receive the guys callsign.

This seems obvious to me. Guess I'm a nitpicker! Sheesh

In article <733974019snx@skyld.tele.com> jangus@skyld.tele.com (Jeffrey D. Angus) writes:
> While we're at it, how about taking an ad for the National Man Boy
>Love Association? (NAMBLA) Assuming of course, that they profess an interest
>in Amateur Radio. What better way for older men to meet young boys than
>through a national magazine with the targeted coverage of QST?

Sounds like a good idea to me. One of the things that attracted me to
amateur radio as a child was that the grown men seemed anxious to accept me
as one of the (amateur radio) group. My Elmer must have loved little boys
to have answered all the questions and requests for help so
enthusiastically and to have let me "help" in the DX contest.

Or did you intend to impute some _particularly_ evil motive to our fellow
amateurs who happen to have a different sexual orientation? Think maybe
they are more likely to be rapists or child molesters than you are? :-(

> Do not point at the Jewish amateur radio organization and use their
>ad as a justification for inclusion of Lambda in the advertising policy of
>QST.

You have it backwards. What requires "justification" is the ARRL policy of
exclusion of _some_ groups when ARRL professes to be _the_ national amateur
radio organization and to represent _all_ amateurs.

> Unless you happen to be Nazi left over from WWII, or perhaps one of the
>more rabid middle eastern groups, the Jewish organization does not espouse as
>controversial a "life style" that those of the Lambda group choose to pursue.

Hmmm. The esteemed NAZIs did treat homosexuals as they did Jewish people.
You say the Jewish group is to be "accepted" because their "lifestyle" is
not controversial (meaning that _you_ don't object) but not homosexuals -
they are controversial because _you_ still want to persecute them? Guess
there are some NAZIs still even if not necessarily left overs. :-(

Re: _espouse_ A little transference going on here? Just because some people
(you perhaps?) would use an organization (like ARRL) to proselytize or
promote their particular religious or social agenda you are not entitled to
accuse that the rest of us, or those you don't like, of behaving so badly.

> The ARRL is dedicated to Amateur Radio. Groups like such as the Jewish
>organization and the Quarter Century Wireless Association get mention in QST
>because their primary focus is Amateur radio.

As, indeed, it is for the LAMBDA group. Their advertisement, which can be
seen in other publications, says it is a club for amateur radio operators
who happen to be gay (just like QCWA is for amateurs who happen to have
been involved for > 25 years).

> If the homosexuals want to form
>a group specifically for amateur radio, then they too will eventually grace
>the pages of QST.

So, you would presume to make _your_ prejudices and the motives you chose
to impute to others the standard for what is "specifically for amateur
radio"! Get serious.

>my favorite band was -- with the same kind of power limits I used...
>And the FCC expected this band to be a local only!?! Hah! It was a
>killer for DX then, and never lost the magic for me...
>
Ah, yes. Although I was interested in amateur radio back then, I
did not obtain a license until 1962. However, at that time (and
for many years thereafter), I used a Heathkit DX-100 transmitter
and National NC-300 receiver, both of which had 11 meters
built-in. I was absolutely astonished at the chaos I encountered
on 11 meters and there were a couple of times when it was
difficult to resist making a comment about it at 150 watts input
on the affected frequency {grin}.

It's also of interest that one of the documents I used to help me
obtain my Novice license was a 1954 Braille edition of the
license manual; it was actually a 1952 license manual reprinted
in Braille in 1954. AT the time of publication (1952), there *was*
a Novice band on 11 meters; if I recall correctly, it ran from
26960 kHz to 27230 kHz. Alas, it was long-gone by the time I
came on the ham scene!

>via the mail server info-hams?
>What would the reorganization buy us???

You will probably be presented with a choice of listserver groups, allowing
you to customize the articles stuffed into your mailbox a bit finer
than the *glob* in rec.radio.amateur.misc ... In fact, one could argue,
that a listserver user would want MORE division of the groups!

As far as posting to news.groups (I know, you can not see the postings ...)
there are several machines on the net that will take
news.groups@<machine name>
and post the article to that group for you! Almost any Internet machine
worth it's salt (is that a challenge I hear :-) will do this!

Talking for Admins everywhere, but not representing them :-) Ciao -- Mark

You are calling us idiots you know, and if not directed at *us*, what
about people like my wife (completely computer illiterate) who understands
these concepts and can hit the '?' key when she doesn't ...

She (VE6MFB) stopped reading rec.radio.amateur.misc a long time ago, and
finds alt.tasteless a more civilized group ...

> I can understand rec.radio.amateur.policy as a way of taking the "You're
> wrong, I'm right" flamewars into an area people can avoid.

No, it is a place made for discussing policy issues, the flamewars still
are in *.misc ...

> I can understand rec.radio.amateur.packet as a location devoid of the
> morse/morris wars. And where the 'real hams' don't have to suscribe to no-
> coder orientated things like machines rather than people talking to each
> other.

? Sounds like you support a division of r.r.a.misc now, as this is what
should happen with well thought out groups, such as Ians!

> But let us not sub-divide rec.radio.amateur.misc for the benefit of those
> who want to further narrow thier view of the hobby.

< minor flame >
I have news for you, I saw you bashing *us*, my wife, no-coders and packet
users in your note, you just alienated another set of amateur radio
enthusiasts! if you are so peaches and cream and want us all together
in a nice family, I'd advise you to practice what you preach!
< flame off >

Now to the point, one can `subscribe' to all the groups, ALL news readers
are capable of reading articles that are cross posted, in their primary
group only. You do NOT see articles twice (unless a user has broken
netiquite and multi-posted) and you can see everything! I do not see
that you are hurt by this progress!

> Conclusion, it ain't broke so don't fix it.

Wrong! the visible complaints are but a tip of the iceberg (I think the
vote will show that), I can count on my fingers and toes the number of people

turned off by *.misc this month that are *visible*. I pity the listserver user that gets mail bombed with 250 articles/day on topics he has no interest in, and certainly *any* news reader (threaded too) that has to discard so much, and read so little.

Ciao, 73 de VE6MGS/Mark -sk-

389. Need serial protocol for Uniden MR8100 scanner

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 18:09:49 UTC
From: Bruce@Pixar.com
Message-ID: <1993Apr5.180949.25111@pixar.com>
Source record: 283814
Cross-posted to: alt.radio.scanner,rec.radio.amateur.misc

I bought a Uniden MR8100 at auction over the weekend.
This is the scanner they designed
for use by the police and other emergency services, not by the hobbyist.
It has an alphanumeric display, a large but simplified control panel, and
no internal speaker. It works well through the front panel, but has
some exotic features I'd like to explore.

The scanner has a DB-9 connector for an "supervisory programming
interface". This is supposed to plug into an IBM PC, and then you can
program the channel memories, send a software command to unlock the
cellular band, and program the alpha display designation for each of the
channels.

I plugged the scanner into my PC, and got it to echo characters at 1200
baud. Unfortunately, I can't get much farther without knowing the
protocol it expects. Distressingly, the scanner stops scanning once it
starts responding to the serial port. Apparently, this unit was designed
for computer-controlled programming _only_. It appears that it will not
scan under computer control. If there are diagnostic functions that
I can access through the serial port, I could probably make it scan.

The local "Scanners Unlimited" store is no help, they only say "you
can't computer-interface that scanner".
If anyone has investigated this scanner, please contact me. I'll be
attempting to get a service manual and software from Uniden if I can.

391. rigs for 70 cm band

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 19:28:30 UTC
From: David.Adams@f716.n109.z1.his.com
Message-ID: <734345081.AA00675@his.com>
Source record: 283474

Organization: Cray Research, Inc.

While thumbing through my latest AES catalog, I notice that several of the rigs advertized which operate on 70 cm offer the capability to transmit on 440-450 MHz. (Example Alinco DJ-580T handheld, DR-599T 2m/70cm mobile. Or on 438-450. (Example Kenwood TH-78A, TH-48A, TH-46AT.)

But I notice that the 70 cm band goes from 420-450 MHz. Why don't these comercial rigs cover the band? Does most of 70 cm go unused? Why?

On other rigs advertised, I could not find any information about what sub portions of the band were covered.

A choke or other RF suppressing device. Try adding 4-5 2-inch(?) diameter
loops a quarter-wave down from the feed point or I think that a ferrite
bead at the feed point might also work.

>It certainly wasn't sold that way. It was presented as a way to remove
>the clutter of bulletins from the discussion group. This was the impression
>given to people who receive the groups via Email.

I was the only person doing the selling, at no point did my hands leave
the table :-) I am sorry that you did not read my postings, as I was very
clear all along that articles would be cross posted and that the group
would follow the news.answers paradigm (at least in my world I thought so).

The listserver, as indicated, would need some updating to filter out
the articles cross posted to rec.radio.info (see below) for the users that
wanted to reduction in volume.

>I don't like crossposts because they multiply the volume to people
>participating by Email.

No, multiple posting does, the listserver is supposed to do:
!rec.radio.info,rec.radio.amateur.misc

If an article is multiposted, it shows up in both places, and *nothing* can
be done about it. If an article is cross-posted, then there IS something that
can be done (as above). Removing a Ham-Radio FAQ from rec.radio.amateur.misc
is not wise (where are the new users going to be?) so cross-posting becomes
necessary.

>You call it a mandate, I call it a minor fraud.
I am sorry you feel that way, the problem comes in that you, and
others, associated the previous failed attempt for a bulletin only group with
this one. I use the word mandate *only* because it shows that my hands are
tied at the moment. Feel free to propose a new mandate, my feelings won't
be hurt!

Certainly, I was cognisant of the fact that rec.radio.amateur.misc was
getting too crowded. The `too many bulletin' postings of a couple of
months ago showed a need for the bulletins to be taken out of
rec.radio.amateur.misc, so I can not lie about that initial intent of many
and the feeling of killing a couple of birds with one stone, but the
realities of the many requests we saw, especially the MAD ones from
the listserv'd people quickly solidified the role of rec.radio.info.

When the cross-posting paradigm moved in, the administrators on the lot all
could see the possibility for the bulletins to be there, and yet not be
there (put your news presentation order on any popular news reader
so that you read rec.radio.info first, then unsubscribe to it, poof, the

bulletins are gone from r.r.a.misc!). This side effect, requiring some education, solved the problem with the listserver people complaining about the bulletins disappearing and allowed the news reader people the filter.

Now, volunteer work that is needed aside to set up such a listserver, one could initially subscribe to a listserver carrying rec.radio.amateur.misc. After time, one could ask to be moved to !rec.radio.info,rec.radio.amateur.misc, or !rec.radio.shortwave,rec.radio.info to their liking ... if you build it, they will come? (urrckk) email dynafeed!

However, with this system, one can see that the onus now falls on the listservers to provide finer tuning of the available groups. A Madhouse that may or may not succede in time. But before any listserver feels comfortable with this, they have to see rec.radio.info as being substantially cross-posted, or `mono-posted', which it isn't yet. Education comes slow!

>Creating more splinter groups is unlikely to have any better effect
>if everything continues to be crossposted between groups.

Ahhh, back on topic! the reorg will not create groups with mandates to cross-post. There are very few articles cross-posted from r.r.a.packet into r.r.a.misc, or r.r.a.policy into r.r.a.misc. This model should convince you that it won't occur with the split. In fact, if you look carefully, r.r.a.policy failed because it became a noise free discussion about Amateur Policy issues rather than a dumping ground for unwanted discussions in rec.radio.amateur.misc. This proves that even a `bad' selection of noise ... er ... news groups will settle out in the end!

Ciao, 73 de VE6MGS/Mark -sk-

394. Any info an the Kenwood TS-50S mobile HF transceiver?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 19:59:45 UTC
From: pereckas@uxa.cso.uiuc.edu
Message-ID: <C510vM.FJy@news.cso.uiuc.edu>
Source record: 283797

I've seen some ads for the Kenwood TS-50S HF transceiver. The ad claims that it is the smallest HF transceiver. Apparently it is about the size of the typical VHF/UHF mobile transceiver. Does anyone know what bands it covers, and the power? Has anyone seen or used one?

thanks,

(passed the tests, still waiting for my call)

>month ago and it came in about two weeks. Not a photocopy either, a real
>softbound manual (about 250 pages).

So far so good...

> I don't have their number, but it is in
>all their ads in QST. I think it cost about $20. It covers the all of the
>FT101 series and includes many modifications to update older rigs to the later
>FT101 configurations.

Not quite. The manual goes up to the 101E. It definitely does not cover
the 101ZD (which wasn't really a 101x anyway). I believe that there was
a 101F which is basically the same rig as the earlier 101 series rigs so
the material should [mostly] apply to it too. How many other 101's were
there. By my count there was: mark, B, E, F and ZD.

While there is info in the service manual to upgrade earlier rigs to the
E, the upgrades required hardware which may or may not be available for
purchase anymore (e.g. the upgrade from B to E required the speech processor
board which may not be the easiest to buy nowadays- it's far easier to
simply buy the 101E).

CELEBRATE LIBERTY!
1993 LIBERTARIAN PARTY NATIONAL CONVENTION
AND POLITICAL EXPO

THE MARRIOTT HOTEL AND THE SALT PALACE
SALT LAKE CITY, UTAH

INCLUDES INFORMATION ON DELEGATE DEALS!
(Back by Popular Demand!)

The convention will be held at the Salt Palace Convention Center and the Marriott Hotel, Salt Lake City, Utah. The business sessions, Karl Hess Institute, and Political Expo are at the Salt Palace; breakfasts, parties, and banquet are at the Marriott Hotel.

Marriott Hotel room rates are $79.00 night, plus 10.5% tax ($87.17 total). This rate is good for one to four persons room occupancy. Double is one or two beds; 3 or 4 people is 2 beds. You can make your reservations direct with the hotel (801-531-0800), or you can purchase your room through one of MGP's payment plans. MGP will provide assistance in matching roommates if requested.

August 30, 31, Sept. 1: Everything You Always Wanted to
Know About Winning Elections, but
Didn't Know Where to Ask!

Three days of intensive campaign training conducted by Sal Guzzetta, a 25 year veteran of more than 200 campaigns. Students receive 990 pages of professional campaign manuals. Everything from strategy and targeting to opposition research, fundraising, and field operations.

Price: $150 if purchased by May 1, 1993
$175 thereafter

August 31 and Sept. 1: Platform, Bylaws, Credentials and
National committee meetings.

Shoot out in Salt Lake! PLEDGE versus Committee for a Libertarian Majority. Will the party's membership and platform definitions change? Is compromise possible? The Platform and Bylaws committees are responsible for making recommendations to the convention concerning changes in those documents. At this convention, the party will only consider deletions to the platform. The Convention Rules would have to

be amended by a 2/3 vote to change this rule.

The meetings are open to the public. There is no charge for attending.

Sept. 2-5, 1993: Celebrate Liberty! Begins
Political Expo Opens

Sept. 2, 1993: 9 AM -- Credentials Committee report to the delegates.

10:30 -- Gala Opening Ceremony and Keynote Address
by Russell Means.

1:00 -- After lunch break, convention business continues
(see "Standing Order of Business" from the "Convention
Rules of the Libertarian Party" at the end of this
document.

Karl Hess Institute of Libertarian Politics Begins, runs in
tandem with the business sessions.

Sept. 3, 1993: Dawns Early Light, Green Dragon Inn (morning and
evening), with Karl Hess Institute and convention
business in between.

Sept. 4, 1993: Dawns Early Light, Freedom Rock '93, Karl Hess
Institute, convention business.

Sept. 5, 1993: Dawns Early Light, Convention Banquet, Karl Hess
Institute, convention business, Joyful Noise.

ACTIVITY DESCRIPTIONS:

DAWNS EARLY
LIGHT Three great convention breakfasts to start your days
right, featuring science fiction author L. Neil Smith,
psychiatrist and author Dr. Thomas Szasz, and South
African Libertarian leader Frances Kendall.

GREEN DRAGON
INN "Opening night" party, named after the famous inn
where Sam Adams and his crowd plotted trouble for the
British over pints of ale and beer. Music, food, drink,
and comedy.

FREEDOM
ROCK '93 Free downtown rock concert Friday night, with drum
circle, comic Tim Slagle, Middle Eastern dancer, reggae,
and local classic rock-n-roll bands. Will be widely
publicized in the local area. Major outreach opportunity.

BANQUET Vivaldi and Mozart, fine dining, in the elegant Marriott
Grand Ballroom (black tie optional). Dancing follows.

POLITICAL
EXPO Exhibits and vendors. FREE admission. Event will be

widely publicized in local area for maximum draw.
Major Outreach opportunity.

KARL HESS INSTITUTE OF LIBERTARIAN POLITICS

Workshops, speakers, roundtable discussions in these areas:

LIBERTY: NEXT
GENERATION High school and college age Libertarians talk
about what matters to them and the 20-
something generation.

AGENDA 2000 Considers key issues of the 1990s. Environment.
Health Care. 21st Century Economics. Drug
War. Second Amendment. Social Services.
Foreign Policy. Crime & Violence. AIDS.

THE GREAT DEBATE LP Strategy and tactics. Media. Ballot Access.
Initiatives. Feminist Issues. Presidential
Campaigns. LP Elected Officials. Grassroots.
Early look at the 1996 presidential nomination.

VALUES FOR
THE 90s Community. Children. Abundance. Home
Schooling. Religion and Liberty. Race.

CAMPUS FOCUS Organizing. Academia. Blue Collar Youth.

CONVENTION PACKAGE DESCRIPTIONS AND PRICES

TOTAL EVENT: All activities, Aug. 30-Sept. 5, $400, including 3
day candidate training

Full Celebration: All convention activities, Sept. 2-5, $300

Late Riser No breakfasts, everything else Sept. 2-5, $250

Thrift No breakfasts or banquet, $150

Issues Focus Karl Hess Institute, $125

Basic Convention packet, souvenirs, two Karl Hess
Institute speakers

Free Political Expo, Access to convention hall,
Keynote Address, Joyful Noise, Freedom Rock
'93, three free outreach speakers.

PLEASE NOTE:
-- PRICES INCREASE MAY 1, 1993
-- Special student prices are available to anyone under 25 years of
age or who is enrolled in a college or university.

-- Six and seven month payment plans are available which can
include housing (if requested).

-- To add the three day candidate training to any package below (except "Total Event"), add $150 to the price.

-- All prices are in U.S. dollars.

-- Advertising is available in the convention program; exhibits and sponsorships are available for the Political Expo. Free Political Expo admission and MGP promotions will draw visitors from the surrounding community (one million people live within a 30 minute drive of the Expo).

-- If your special interest group, organization, committee, or cause would like to schedule space for a presentation, contact us.

-- MGP conducts a drawing each month and gives away FREE hotel nights. The sooner you register, the more chances you have to win.

-- Roommate match service available upon request.

OTHER EVENTS:
"Anti-Federalist Two" MGP sponsored writing contest. June submission deadline. Contact MGP for prospectus.

"The Libertarian Games" Friendly competition -- marksmanship, computer programming, chess, maybe more.

Libertarians for Gay & Lesbian Concerns Business meeting, social night, sponsored by LGLC.

??? YOUR EVENT CAN BE LISTED HERE. Contact MGP for details.

ATTENTION COLLEGE STUDENTS!

Special discounts are available for college and high school students. We will work on casual housing opportunities for the "Poverty Caucus". College Libertarians will meet at Celebrate Liberty! and discuss the future of their movement on campuses. Contact MGP for more details.

LIST OF SPEAKERS
(as of March 14, 1993):

Dean Ahmad Jim Hudler Sheldon Richman
Karen Allard Jeff Hummel Kathleen Richman
Rick Arnold Alexander Joseph Dan Rosenthal
Dr. George Ayittey Frances Kendall Dr. Mary Ruwart
Alan Boch Martin Luther King Dagny Sharon
Richard Boddie Me-Me King Jane Shaw
Gus Dizerega Henry Lamb Sandy Shaw
Larry Dodge Amy Lassen L. Neil Smith
Dr. Richard Ebeling Scott Lieberman Eric Sterling

Don Ernsberger Dr. Nancy Lord Dr. Richard Stroup
Bill Evers Russell Means Dr. Thomas Szasz
Bonnie Flickenger Vince Miller Michael Tanner
John Fund Maury Modine Sojourner Truth
Doris Gordon David Nolan Yuri Tuvim
Leon Hadar Randall O'Toole Bob Waldrop
Patrick Henry James Ostrowski Terree Wasley
Karl Hess Dirk Pearson Perry Willis
Dr. Karl Hess Jr. Bob Poole Richard Winger
Jacob Honrberger Carole Ann Rand Jarret Wollstein
Brigham Young

UPCOMING CONVENTION DEVELOPMENTS!

On May 1st, prices increase for convention packages, candidate training, and exhibits/advertising:

New prices for convention packages will be:

Total Event: $450
Full Celebration: $350
Late Riser: $275
Thrift: $175
Issues Focus: $150
Basic: $30
Free: $0

These prices good through July 2, 1993.

BACK BY POPULAR DEMAND!
ANNOUNCING THE DELEGATE DEALS!
Available May 1, 1993

I: Business Focus: All convention activities except Karl Hess Institute -- $275

II: Delegate Celebration, includes a complete set of Karl Hess Institute audio tapes instead of institute tickets -- $350

STANDING ORDER OF BUSINESS FOR
A LIBERTARIAN PARTY CONVENTION

1. Call to order

2. Credentials Committee report

3. Adoption of agenda

4. Treasurer's report

5. Bylaws and Rules Committee report (Non-nominating conventions only)

6. Platform Committee report (At non-Presidential nominating conventions only deletions may be considered.)

7. Nomination of Party candidates for President and
Vice-President (in appropriate years)

8. Election of Party Officers and at-large members
of the National Committee

9. Election of Judicial Committee

10. Resolutions

11. Other business

398. Re: Re: RFD [rec.radio.amateur reorg]

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 21:01:49 UTC
From: scott@hplvec.LVLD.HP.COM
Message-ID: <21870026@hplvec.LVLD.HP.COM>
Source record: 283641

In rec.radio.amateur.misc, ikluft@uts.amdahl.com (Ian Kluft) writes:

>Such a pessimistic view of the world... Things can work much better than
>that. In rec.aviation.*, which was reorganized last Summer, my news spool
>shows 13 newsgroups with 336 files (5-day retention.) Of those, 41 are
>cross-posted between more than one rec.aviation subgroup. Most of those seem
>to be from an attempt to find the most appropriate groups for the topic. Only
>26 of those even include rec.aviation.misc in the cross-posting.

ACCHH! PTUI!! Put me down as adamantly apposed!!!

As a long time rec.aviation participant, allow me to present a slightly
different viewpoint from Ian's. I dislike much of the rec.aviation
hierarchy!

A few of the new groups work, and don't generate copious xposts. These
are the groups that are *clearly distinct* and stand on their own, such
as .military, .soaring, .homebuilt and .simulators. The rest
(.piloting, .owning, .products, .answers, .student, .stories, and .misc)
represent xposting hell. I appreciate the statistics Ian presents, but
xposting tends to ebb and flow in the hierarchy. If you factor out the
few well divided groups, the percentage would rise appreciably. I've
seen times when *most* of what was posted in the .piloting, .owning, .ifr,
.student, .products, .stories and .misc groups was xposted to at least
one other group.

>That sure doesn't seem like an epidemic of cross-posting. Considering that
>rec.aviation before its reorg was very much like rec.radio.amateur.misc today
>(including traffic volume and attached mail lists) I really don't think it's
>going to be a problem.

That assumes appropriate sub-groups. To my mind, the subgroupings
offered are no more distinct than the less succesfully split
rec.aviation groups.

>So, if we *do* split rec.radio.amateur, we'll have several other groups with
>better signal-to-noise ratios, making a much more enjoyable environment for
>Hams, considers what varied interests we tend to have.

>It CAN work... just look at where it has worked.

Sorry Ian. I'm truly not trying to be contrary, but I believe you're
operating from a false premise. I respectfully disagree.

Read a little further...:-)...they are all ON THE SIDE OF THE FCC in trying to stop the broadcasters. The argument is whether the FCC using monetary forfeitures is legal and proper; the broadcasters say no, and want to have the FCC stop it; the rest say yes and want the FCC to keep it up (and be found to be enforcing this as a proper exercise of their authority).

I.e., ACT, ARRL, et al are FOR-FCC, ANTI-INDECENCY to the extent that they think FCC's actions are proper. Broadcasters are against the notion that this particular mechanism of FCC is proper.

IMHO, that is...

400. Please help. PK-232 vs KAM

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 21:48:00 UTC
From: v111qheg@ubvmsb.cc.buffalo.edu
Message-ID: <C515tv.1Cu@acsu.buffalo.edu>
Source record: 283804

OK. I know this question was solved years ago on the net, but I wasn't around then so dont flame me.

I am sick ad tired of my PK-232MBX's noise problem, and I am not about to go soldering right next to IC's, so I've decided to ditch my PK-232. Has anyone had any problems with RF from their KAM or newer PK-232 tearing up their HF's front end? Does anyone have any negative experiences with the KAM? How about newer '232's?

Thanks for any responses, as all help is appreciated. 73,

Peter KB2NMV

401. rigs for 70 cm band

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-05 22:28:30 UTC
From: dadams@cray.com
Message-ID: <1993Apr5.172831.18824@hemlock.cray.com>
Source record: 283446

While thumbing through my latest AES catalog, I notice that several of the rigs advertized which operate on 70 cm offer the capability to transmit on 440-450 MHz. (Example Alinco DJ-580T handheld, DR-599T 2m/70cm mobile. Or on 438-450. (Example Kenwood TH-78A, TH-48A, TH-46AT.)

But I notice that the 70 cm band goes from 420-450 MHz. Why don't these comercial rigs cover the band? Does most of 70 cm go unused? Why?

On other rigs advertised, I could not find any information about what sub portions of the band were covered.

Message-ID: <1993Apr5.224434.587@ttinews.tti.com>
Source record: 283429

I worked KN5BN near tulsa recently. I generally use the on-line call book for address info since I do not need callbook info often. However, the on-line one has calls thru around 6/92 and this call just missed that deadline, so I am pretty sure that he is in the '93 callbook.

Bottom line: Would some kind soul with a '93 callbook please send me this guys name & address so that I can send him a qsl card? Thanks, in advance.

> examinations, video, repeaters
> [unmoderated]

We have two proposals on the table here! I have not seen many comment in
any major fashion about these two proposals. I for one, support the
rec.radio.amateur.tech group mainly because it appears to work well
in rec.bicycles.tech and rec.autos.tech (well, sort of, at least they don't
see the flame wars on rec.autos :-) and once you remove the digital group,
how many people are left on the net that actually own a Multimeter :-)

Do we realy think that we will have enough traffic in that is differentiated
enough in .construction, .products or a .homebrew groups?

I propose keeping rec.radio.amateur.space and rec.radio.amateur.tech

The fly on the wall speaks! Ciao -- Mark

So, what about all the DX that's packet-spotted? You know the call sign before you even hear the station - So, as a general question, are you sure that you could copy his call in all cases without this prior knowledge?

Just a thought...

I read it several times. I think the phrasing of the bulletin copy is
somewhat ambiguous. I'm glad to hear that ACT is one the sensible side
of this. That's a pretty good organization.

I hope the suit (against the FCC) goes nowhere. The FCC has its monetary
forfeiture authority from congress. If they think they can make a case,
that's where they should go. There are enough looney federal judges though,
that one never knows.

First... is the call sign server at Buffalo going to be updated soon?
I believe that it has been since last summer some time...

Second... Anyone have a copy of a service manual for a Kenwood TH-21AT??

Third... anyone know about how far the FCC is with assigning calls? I
just pasted my tech test about a week ago, and am wondering if I am going
to be an n8??? or a K?8???.

Later.

Source record: 283626

As I'm sure many of you Icom 24At owners know, there are two mods that require the remval of two diodes, D13 and D14. These two diodes are placed in an obvious place in the back of the radio and beg to be cut. Removing D13 enables the extended receive function. This is not a problem as D13 was not installed by the factory in the first place. Removing D14, it has been said, enables the cross-band repeat option during the cross-band full-duplex mode. This is a problem, as mine has the D14 installed by the factory. Has anyone tried this mod, i.e., cut D14? Does it really work??

: back down the outer of the coax ???
:
Exactly correct. Contrary to popular opinion, there is nothing magic
about the matching stub as far as decoupling RF currents from the feedline
is concerned. The J-pole's high impedance feedpoint does tend to limit
feedline current somewhat, but a 1/4-wave ground plane with 4 radials
does a better job. About 10 dB better, according to some backyard tests
we did awhile back.

Well, I gave up looking at the feed on my J-pole antenna. I understand how the quarter-wave stub matches to the voltage-fed, high-impedance half-wave radiator, but looking at how the coax is attached, there *MUST* be RF forced back down the outer of the coax ???

But I've seen these antennas used in repeater applications where there must be _no_ RF on the screen.

What am I missing ?

replies, please, to <Steve_Wright@kcbbs.gen.nz> as well as the news.
regards,

Steve - ZL1BHD

413. FLEA at MIT Sunday April 18th Cambridge MA

Spring has Sprung in Cambridge
so it time for the monthly Flea at MIT to start up.

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
April 18th, 1993
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 400 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $2 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered
tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

The ARRL never refused to run their ad. They said they couldn't run it on the schedule that Lambda had demanded. (Its past the deadline, but they want it in a certain issue anyway!). Next thing the League knew, they were being threatened with a lawsuit.

Thats what a friend at HQ told me. The ARRL couldn't figure out why they were being accused of discrimination for applying the same ad deadline to Lambda that they apply to everyone else.

The MFJ has very poor filtering on the front end, compared to the PK232.

As a result, it doesn't copy nearly as well on HF.

422. Russian Amateurs in Tomsk address ??

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-06 08:31:27 UTC
From: jmitchen@serval.axion.bt.co.uk
Message-ID: <1prf50$l4g@zaphod.axion.bt.co.uk>
Source record: 283824

Does anyone have a later DX listings callbook than 1991
that might have an address for UA9HTT ??

I have a friend visiting from Tomsk at present, and he
would be interested to know whether there are any other
amateurs that live nearby their home. The guy above,
UA9HTT is the only one I have worked from there, and his
QSL card which I dug out gives no direct address (of course)
since its quite old (1990). Not uncommon then!

All UA9H** should be in that area (OBL) so I would appreciate
anyone letting me know if they have any possible contacts
listed in their callbooks.

Replies to: jmitchen@axion.bt.co.uk please,

Thanks,

Jonathan.

>KAM? How about newer '232's?

Well Peter, if you don't solder, I guess trading is the only option,
but the 232 really is easy to quieten if you're willing to do a little
work. The KAM is a little quieter out of the box, but it's performance
is a little worse too, so you don't gain anything. AEA still paints
their cabinets, so the newer machines aren't much quieter than the older
ones, though they have improved the filters a bit. All it takes is sandpaper,
star washers, and a few extra screws to quieten these boxes. If you wish,
you can also add 0.1 uf caps across each IC. That will help things a little
more. But it's getting rid of the paint and getting a good electrical
bond on the case halves that really does the trick.

424. Re: ARRL living in the past? (was Re: motive ...)

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-06 13:01:44 UTC
From: dstock@hpqmoca.sqf.hp.com
Message-ID: <C52C6x.4JF@hpqmoea.sqf.hp.com>
Source record: 283578

The RSGB has been making a number of changes to escape from an image of living in the past, I hope they succeed. A quick flick through the recently restyled RADCOM shows two regular contributors to have names that suggest that they may be women (with photographs to match). I wondered whether this was a deliberate act to create a more balanced appearance, but as I've met one of them at G-QRP conventions, and I've read all the regular 2 page articles of the other (EMC specialist), the conclusion is inevitable that these people are no mere window dressing, they are competent authors with strong knowledge and interests in their respective areas.

I feel that a publication or a society should use the best available (and willing!) people. If it happens that the available population is biassed strongly in some way, I would still want them to pick the best, irrespective of non-radio details. The cause of such a bias in the population is a separate matter, and should be a cause for direct rather than indirect concern.

I strongly believe that people should be free to choose their own hobbies (and careers), that it is wrong to decide for them just what is "suitable" and "unsuitable".

I went to a school that was very pro-arts, yet I was interested in engineering. There were methods akin to water dripping on stone to steer pupils towards a proper arts career, scientists were subtly discouraged, engineers were aliens. I can only suppose that the pressures on girls to avoid "technical" interests must be worse. An elderly lady lecturer in electrical engineering was once discussing her career choice with a class I was in, she remarked that the only way a boy could feel similar pressure would be to announce he had chosen ballet dancing as a career. The class went quiet after that!

Cheers
David GM4ZNX

> people laugh "Hi-Hi" on phone!
> Bruce KD6OTD

There's no doubt the *original* usage of XYL was what we would now think to be sexist. It actually stood for ex-young-lady, and distinguished the person referred to from a YL -- young lady -- an unmarried woman, a "miss." Usage now, of course, parallels Mr. with Ms., and no longer makes that distinction.

However, words constantly change their meaning. For example, according to my OED, "woman" itself comes from the old english "wifmon," meaning a wife, or potential wife, and therefore carrying with it the implication of women as some man's property. That sense of "woman" is rapidly disappearing, however, and I don't know of any particular movement to get rid of the word itself. Similarly, could we not come to think of XYL (or YL, if you like) as standing for MS? If you want to make a change parallel to MRS, MISS --> MS, how about XL? I just think there's some value to our hobby to hanging on to, or only gradually modifying, those of our traditions we can hang on to.

For what it's worth...

428. STS-56 Launch Scrub

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-06 13:58:06 UTC
From: abfhb@stdvax.DNET.NASA.GOV
Message-ID: <9304061358.AA11707@east.gsfc.nasa.gov>
Source record: 283582

SB SAREX@AMSAT $STS-56.002
STS-56 Mission Launch Scrub

At T-11 seconds, the launch of STS-56/ATLAS-02 was halted when a liquid hydrogen high pressure bleed valve failed to indicate closed, causing an automatic shutdown prior to main engine ignition and initiating safing of the vehicle.

This is reminiscent of the recent problems with STS-55, but one should not immediately jump to the assumption that the failures are the same. At this time, it has not been determined whether this scrub was caused by an actual problem in the hardware or by a sensor or instrumentation error. Preliminary information indicates it may be an instrumentation error and not a hardware problem.

The current activities are to evaluate the nature of the problem which caused the launch scrub and to recycle the launch as soon as possible. At the post scrub press briefing, Shuttle Deputy Program Manager Brewster Shaw described a 48 hour launch turnaround if it was indeed an instrumentation problem which caused the launch scrub.

More data will be sent as we learn what happened, and when we can expect another launch attempt.

Submitted by Frank Bauer, KA3HDO for the SAREX Working Group

431. vertical in the woods?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-06 14:14:07 UTC
From: f_speerjr@ccsvax.sfasu.edu
Message-ID: <1993Apr6.081407.3917@ccsvax.sfasu.edu>
Source record: 283587

Hello, all,

I have several acres of pine woods, and would like to stick a phased array of verticals on 10 mhz in it. But I'm worried about absorbtion by all those pine trees. Yet I note in the literature recommendations for wire vertical antennas hanging directly from tree branches, where the antenna element would be only two or three feet from the support tree. I could probably arrange the same spacing, although there would be a good many trees BETWEEN the individual verticals.

Anybody got any relevant experience/suggestions?

Thenks and 73!

I don't have my catalog handy to verify price Radio Shack has
two conductor wire (insulated, flexible don't remember size) that works out
pretty cheap on a per foot basis after splitting. This is real handy for
antennas with equal length elements (dipoles, etc.) ... measure, cut split.

An associate of mine picked up an interesting-looking
piece of equipment at a sidewalk sale a few weeks ago
and is now trying to find out info about it.

It has a label on it that says:

WEAFAX RECEIVER
FG ENGINEERING
FRIEDONIA, AZ 86002

and another that says:

Property of US Government
NASA 2436

It has an N-connector in the upper left corner,
a 5-pin female twist-on connector in the upper
right corner. A Schraeder valve (like a tire
valve).

Called FG Engineering and spoke to Fred Griswold (wasn't he
in National Lampoon's 'Vacation'?). He says that they don't
have any info on it anymore...too old. If you have any info,
would really appreciate hearing from you. Email:

I rather think it means most people just plain aren't interested in this subject one way or the other, and wish you'd go argue it somewhere else.

The whole thing reminds me of someone I once saw making a big stink to the manager about the food in a fast food joint. After the guy finally walked out in a huff, everyone else simply turned back around and resumed ordering their meals. I guess the guy expected everyone else to follow him out...?

I have seen little or no RDF discussions in the rec.radio.amateur.* heirarchy (except for some associated with the 14.313 and FCC policing). In fact, I have seen little or no RDFing in my area, bunny hunts almost are a thing of the past ...

With the advent of packet radio, RDFing a signal has become excedingly difficult without the best of equipment (TX signature analysis and high speed direction) beyond the means of most Hams. But I wax poetic ...

I don't think there is enough discussion volume to justify, take it to r.r.a.tech!

> up their HF's front end? Does anyone have any negative experiences with the
> KAM? How about newer '232's?

Peter-

Regardless of what the problem is, maybe its time for a change. The PK-232 was king when it first came out, but is getting old now. The KAM is highly regarded by many. Its one advantage that would sway me, is its ability to act as a gateway between HF and VHF. Just don't be too upset if they come out with a KAM version 2, right after you get one!

So, you get a new TNC. What if the noise problem doesn't go away? I've had no such problem with my PK-232 on receive. However, I have had some problems with the computer I use as a terminal. It is essential to separate the antenna from your digital equipment, whether its the TNC or the computer or a nearby printer. Sometimes its hard to determine which piece of equipment is causing a problem, since noise can be carried over the interconnecting cables. This is a reason to only use shielded cables, including the RS-232 and printer cables.

My only "noise" problem with the PK-232 turned out to be a power supply problem. It seems that transmitted RF was getting into the power supply regulator. Rectified RF was upsetting the regulator bias to the point where it oscillated at an audio rate, somewhere near the frequency of the FSK tones. The power supply output consisted of DC with this audio riding on it, with the low point on the waveform going below the value that the PK-232 power filter could handle. Subsequently, the tone was passed on to the transmitter microphone circuit. The solution to the problem turned out to be removing a second piece of equipment that was sharing the power supply, and using two separate supplies.

In the process of trouble shooting this problem, I observed that the PK-232 already had fairly good filtering, both on the power supply and the other input/output circuits. I won't say it doesn't radiate some digital hash. However, I doubt it will be much different from other comparable TNC's.

> what bands it covers, and the power? Has anyone seen or used one?

Michael-

The TS-50 is comparable to the larger Kenwoods in most respects. It has general coverage reception from 500 KHz to 30 MHz. It transmits SSB/AM/FM/CW on Ham bands from 160 to 10 meters. SSB/FM/CW power output is 100 watts, reduced on AM.

The TS-450/TS-690 class radios have more features, but are significantly larger. I would definitely recommend the TS-50 for mobile use because of its size, but would prefer the larger radios for base station use.

The TS-50 has fewer controls on the tiny front panel, so they are used for more functions. There are also 4 buttons on the microphone that can be programmed for your choice of functions, using the radio's built-in menu system.

The AT-50 tuner is in a separate package, identical in size to the TS-50. The combined size of the pair is still smaller than the TS-450AT, but you would probably want to hide the tuner under a car seat or in the trunk, using the optional long cable.

I could continue, but you would learn more if you can find a store (or hamfest) that has one available for demonstration. I purchased mine from Amateur Electronic Supply in Orlando. Their basic price was $1039, but stores in other areas have it for as low as $975, so I've heard.

Not everyone reads news on a Unix box. I'm running POW(Plain Ol' Waffle),
and on my machine, cross-posted articles get read multiple times, in each
cross-posted newsgroup. I'm personally in favor of a split, but the
argument that no one will read cross-posted messages more than once doesn't
wash.

> how it's affected, but I shall do so tonite.

Pat-

I aligned the carrier oscillators on my TS-430 over the weekend. I found that the USB carrier oscillator is also used on CW receive. The CW carrier, which is 800 Hz away, isn't what's affecting your reception.

Alignment is done with the IF Shift centered. Afterward, you vary the IF Shift control throughout its range, and verify that the carrier oscillator frequency goes beyond certain upper and lower values.

Have you noticed a change in the sound of noise on a dead band, when switching between USB and LSB? If the difference is significant with the 2.4 KHz filter, it is an indication that the two carrier oscillators are not adjusted an equal amount away from the filter's center frequency.

If you have one of the CW filters, USB carrier frequency is more critical. I suggest you adjust the USB carrier by ear with the CW filter on and the IF Shift centered, and living with the resulting USB alignment. With the normal 2.4 KHz SSB filter, you may not notice any difference.

Well, I have the 232MBX. I recently did the factory authorized
AMTOR filter mod (changing out a few resisitors). AEA provided
the resistors, and extra resistors in chase I want to change back.
I have operated the 232 during times of really crowded and
times of really noisey conditions. I now have perfect copy
even when the signal doesn't move my S meter. I don't get
to use a KAM so can't do a direct comparison. I like the
KAMS dual port ability and the software I have seen (the latest
version). Can't imagine needing anything better for RTTY
AMTOR and VHF packet.. I can't stand HF packet so it doesn't

matter to me whether or not that even works. I recently ordered the
PACTOR upgrade.. and use ACUTERM .. Acuterm upgrade is going

to cost me a whole $15

From: ag821@yfn.ysu.edu
Message-ID: <1psi8u$327@news.ysu.edu>
Source record: 283596

I was recently in the market ffor a good straight key
capable of 20-35 wpm and a sensitive feel. Wasn't
really in love with my Speed-X, although it worked
fine when I finally had it adjusted the way I wanted it.

The good English and German keys were about $200 (Schurr
in W. Germany had a beautiful one.. and his work is fantastic)
Looked through old mag. articles and dug out all my catalogs and
called every 800 ham radio #.

Found a catalog from CQ Radio Kits, in ONtario Canaday. VE3EGA, Terry.
He sells Oak Hills Research kits.(they don't say Oak HIlls, but its
the identical cat.. may just be the Canadian distributor.. Well on the
back of the QRP section is a couple of pages about the "MERRICK"
straight key. The key is "completly hand build out of brass-stock
with teflon insulated gold contacts. Each key is individually 'tuned' and
balanced for high speed CW operation. It is approximately 4 inches
long and features a solid brass base with rubber feet"

The key was $75 + 6.50 SH. I took a chance and certainly am glad
about it.. what a beautiful key. It looks beautiful (to me)
and has the best feel I have ever come across and I look forward
to using it each day. (boy am I out of date for a new ham..not
only do I love CW.. but actually enjoy a straight key more than
a set of paddles (I own Benchers and in my car a set of mini
Schurr paddles).

I have nothing to do with this company ..except as very satisfied
customer

You, sir, should realize that:
1. the two are not disjoint - the topic is the politics of amateur radio organizations.
2. an Angel of the Lord may have appointed you to regulate the terms of the discussion, but the rest of us may not recognize your authority.
3. If you make statements here, you will bloody well take responses here.
> I have definite political feelings, but will
>not discuss them here or on the air.

Your next paragraph gives the lie to this assertion.

> It is bad form. Amateur radio is
>for encouraging international goodwill. This is in contridiction to the
>discussion of contriversal issues.

However, no single group can arrogate to itself the right to forbid discussion of any issue, especially not about its own behavior, on the grounds that discussion of the topic would offend members of that group. You have not the right to unilaterally decide what is "controversial" and so "forbidden" for the whole community of amateur radio operators.
>
>There are those who still believe a homosextual lifestyle is wrong. You
>are advocating forcing a lifestyle on those individuals.

Really?!! You claim that full participation in our hobby by those of one particular sexual orientation will force those who choose otherwise to adopt that orientation? This reeks of the claims that Gypsies steal little children and .... Force you, or anyone, to adopt some "lifestyle"? Of course not. Insist on common politeness and acceptance of _all_ our fellow hams on the air and in our national and international organizations. Of course. Good grief man, this isn't the dark ages! I hope. 8-)

> If you want to
>discuss this with me further, please post only to the radio.amateur.policy,
>or I will not respond.

Interesting that you insist on a right to unilaterally set the terms of discussion and to exclude others from the forum. What was the name of that Angel, anyway?

If, of course, you choose to withdraw because you find the people here uncongenial you might recall that was the genesis of this discussion: The fact that Gay hams are made to feel so uncomfortable that they finally seek more congenial company - and the difficulty they have had in availing themselves of national circulation Ham magazines in arranging that.

I understand that the VHF port on the KAM is only good to 2400 baud. I took one apart the other day and found out why - the HF and VHF modem data is connected to two general-purpose I/O pins on the microprocessor, meaning it is a software-USART type arrangement similar to the BAYCOM. I don't understand why a "modern" packet controller would do this on the VHF port.

Can the PK-232 have both radio ports active at once, and is there also a software USART even for VHF operation?

Actually, there have been suggestions from the direction of the
"woman's movement" (or whatever the PC term for it is now) that
"woman" should be changed to "womyn" or somesuch, to get at exactly
what you mention above; the sense of derivativenss and property. As
though the basic societal unit is a man, and a woman is kind of secondary.

>confident that more newsgroups will work?

We've already been through this point several times. Yes,
rec.radio.amateur.policy has not accomplished its goal because it was intended
to be a dumping ground for an unwanted topic. That is why ALL of the groups
proposed in the RFD have taken their example from rec.radio.amateur.packet,
which is a definite success story. It was based on a topic people are
interested in. So all the proposed newsgroups are too.

>All that will occur is that EVERYBODY will cross-post to a
>r.r.a.m. as well as the specific group.

Cross-posting is too much work for most users. They won't do it in the
numbers you fear. Some will, but it will most likely be insignificant
compared to the regular traffic in the groups.

Roy, this seems like an honest mistake, at least the guy tried. I've posted requests for Mac software info, and then gotten flamed from the "DOS-hole" crowd. I've also asked "Has anyone heard of XXXX?" and gotten replies that say "Yes." I then have to email back an excruciatingly specific message detailing the exact info that I wanted. But, hey, I deserved it! I should have been exact in the first place.

> really? And why may stations in auxiliary operation only communicate
> with "other amateur stations within a system of cooperating amateur
> stations?"
>
> (I refer to exam questions 4AA-4.1 and 4AA-4.3 etc.)

Ok, here's how I remember it:

A station in Auxiliary operation is usually one that's linked into a
net. An example:

```
441.750+KD1HZ/RPT PRV 146.700-WA1RBT/RPT CRN 145.170-KA1JNP/R CRN
| | |
|_____________________|_____________________|
|
|
The New England Cheeseball Net
```

Each of the stations above would be in Auxilliary operation and are only
authorized to communicate with other stations in the same system unless
arrangements are made to link systems too.

Actually it's quite simple. There's a danger that you might be inclined
to push the sales of the products you either make or distribute. Not a
good idea to say the least.

Tony

When I think about it, back around 1977 or so I used CB's a little bit,
but it was alot different back then. I lost interest because, as you
said, it gets boring.

> After I obtained my license, a friend of mine who was into CB *insisted*
> on visiting my station. He wasn't very impressed watching me (attempt)
> to call CQ on 40 meter CW with my HW-16 and HG-10 (yeah, I know you were

But thats the thing, a ham shack shouldn't have to look pretty as long
as it does the job. Personally, the more techie it looks, the better. :)

> So I think the no-code Tech, as it currently exists, is a Good Thing.
> I was also quite pleased with the Novice enhancement giving phone privies
> on 10m. When I obtained my first Novice license, I would have had to
> travel 180 miles, to Chicago, to upgrade it to general. Nowadays, thanks
> to the VEC system, you can get a license with little effort. There has
> never been a better time to get into amateur radio.

Agreed but some mistakes were made. The theory was watered down quite a
bit so that now it's just rote memorization if you buy WB6NOA's books. I
will admit that I used the RS books up to General and then switched to
the ARRL books because RS didn't got higher than General at the time.
With the ARRL books I actually learned the theory behind the questions
so that no matter what you threw at me, I could pretty much do it.

Now all I have to do is pass my element 1C this Thursday and boom...
Extra, only 364 days after I took my no-code.

Tony

460. UHF TV ANTENNA QUESTIONS

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-06 21:43:21 UTC
From: Your Name Here <NetID@cornell.edu>
Message-ID: <1psthqINNssk@newsstand.cit.cornell.edu>
Source record: 283628

Howdy all:

I need to put up a UHF television antenna and I have a few questions regarding possible choices.

I want to receive channels 25 and 68. 68 is about 30 airmiles away, and I can currently receive it well using the whip antenna an my portable when I stand on my roof. 25 is much further away. (I am in Groton NY, Station is in Toronto, abt. approx 250 mi.) I can receive 25 weakly on my vhf (an old, but really, really large Gerrold.) antenna, when it is turned about 90 degrees away from the "proper" direction.

My plan is to hang a four or eight bay bowtie antenna from Channel Master. Should I be considering some form of Yagi-style instead?

I plan to use RG11 as my feedline and a radio shack balun. Should I consider anything else in place of these.

Anybody know a good mail order firm for Channel Master and other TV antennas?

Thanks,

Peter Morenus (pam2@cornell.edu0

Source record: 283614

Dear OM,

I have an Alinco DJ-120 VHF (144-146 MHz) tranceiver and I use it
mainly for packet radio. The main problem is that I cannot disable
the battery saver function, so I often lose packets. Does anyone
out there know how to disable this function?

I would like also to use it with a transverter for 430-440 MHz
and I have been told that it can be modified to cover 140-150 MHz.
Does anyone know how to do it?

Please reply by e-mail, as I have no regular access to
the Net-news, to the following address:

kkrallis@leon.nrcps.ariadne-t.gr

Thanks and 73

You fellows have it all wrong. That ARRL policy about not discussing politics and religion was done away with years ago. Back then, we discussed things like emergency communications ... advancing the radio art ... advancing communication skills ... providing a reservoir of trained technicians and electronic aspects ... enhancing good will.

We really didn't get into sexual preferences.

73,
Steve, NO8M @ NO8M.#NEOH.OH.USA.NA

463. Audio Tube Amp. RF Parasitics

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-06 22:57:33 UTC
From: sidhu@ee.ualberta.ca
Message-ID: <1993Apr6.225733.8724@kakwa.ucs.ualberta.ca>
Source record: 283619

One day while working on one of my homebrew tube
audio power amplifiers, the ground prong on my 'scope probe
briefly touched the plate connection on one output
tube, while the amplifier was idle on my test bench.
The amp uses 12AX7 pre&phase-inv., 6SN7 driver, and
two 6550A's in class AB1 for outputs. The output xformer
is a Hammond 1650N (4300ohms CT). B+ is around 540V.

Well, anyway the result was an instant silent arc occurring
between the contacts on the 6550 tube socket (just the one the
probe nicked). The arc stayed for a few seconds before my brain
figured out what had happened and then I hit the stand-by switch.

The amplifier survived (new O/P's added anyway) but I was puzzled
as to why you could at least 20kV+. A bit of pondering and I figured
the parasitic LC's in the output transfomer and tube could get loose
and raise hell. I want to fix this bug but I wonder if anyone has
some advice. There are at least 3 ways to fix this:

1. Add small air-core choke or 47ohm res. in series w/plate
connections.

2. Add RC circuit between O/P tube's plate and control grid.

3. Add RC circuit across each winding of O/P transformer
primary windings. I know this is usually done to compensate
for the xformer's self-inductance. But for RF ?

4. The "grid-stop" resistor (~1k) monopolizes on the miller-
effect, but I think it limits the tubes bandwidth wrt to it's
input signal, not wrt to the tube itself. In other words, this
appears to be a useless "cure-all" popular nowadays in audio.

After looking at several old amp schematics, I found ones from
the 40's and very few afterward included any of these 3 fixes. These
RF stoppers are simple enough but what about actual values? This
is also a problem for HAM high-power transmitters, as the high-
voltage at the parasitic resonance can easily fry $$$$ of tubes.

Ken

I don't believe that we have to take the behaviour of broken software
into account when determining the policies of the network. From this
persons description of the process, POW doesn't obey the standard
paradigms of Usenet software, and so its behaviour does not count.

I posted the question: how to preserve the labels.

Basically there are two responses -- clear fingernail polish or
use the vinyl case with the clear plastic cover.

I have the vinyl case but it's no good when I'm using the larger battery.

I wonder if nail polish will disolve the buttons?

Thanks to KA0IQT (Jim) and someone else whose name I lost and all
who posted followups.

>
>It is an oft repeated maxim, and one that bears repeating again:
>Get your software fixed.

He can't. There aren't many ways to do uucp, news, and mail on a PC running DOS. (If you've got a 386 or above, I'd suggest looking into Linux - it's POSIX and it's free. See comp.os.linux for details.) But on a 286 or below, waffle is pretty much the only real choice. So, users can't fix it - they pretty much have to bear with what the author(s) distribute.

It isn't ideal. Its deficiencies are why they are called "waffle irons" by Unix users. But it's a way to get news and mail if nothing else is available.

However, the NetNews community is not going to lower its expectations because of waffle's appearance on the scene with the inability to handle news articles according to the de-facto standards. So, while it isn't right to say "Get your software fixed" to a waffle user, neither is it correct to change any proposals just for waffle. At some point, you will need to send input to the authors saying you want proper handling of cross-posted articles because they are a reality - and in the cases they were designed for, they are even useful. Once they fix it, the problem will be solved for all of us.

468. Re: Need help with Kantronics KPC-3

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-06 23:36:07 UTC
From: quent@teal.csn.org
Message-ID: <quent.734139367@teal>
Source record: 283623

Earlier I posted a plea for help with connecting a Macintosh LCII, Kantronics KPC-3 TNC and Alinco DJ580 HT together. I figured it out before any responses showed up. In case anyone else is trying to do this here's what I found. (I don't know why I didn't post it to the packet newsgroup!)

The radio side:
The radio hookup was done using the manual's example for the ICOM 2AT radio but the resistor value was too small. I added another 1K to the 3.9K shown in the diagram; it works fine. Next I'm going to try a 4.7K for less bulk than two series resistors.

The computer side:
I use hardware flow control with my telephone modem but the modem cable wouldn't work with the KPC-3. (Now I need to review the modem configuration to see just what signals it's using.)

The answer:
Although the KPC-3 manual talks about hardware flow control it doesn't make it clear that the factory default requires RTS/CTS flow control. At least I think this is the case.

My solution:
On a female DB-25 connector I tied pins 4&5 and 6&20 together and did the same on a male connector. Then I connected pins 2,3 and 7 straight across between the connectors. Probably the TNC end only needs 4&5 and 6&20 tied together but this is no science experiment; I just wanted it to work! In fact probably only 4&5 need to be connected.

Next project: TCP/IP & KISS...

I am moving to a new location, but my mailing address (a PO box) is not changing. Do I still need to file a form 610 with the FCC to give them my new station location? I thought I heard somewhere they no longer require station location information (though it's still right here on the form).

> > --

You're right. I was wrong. When I checked my own system I found only 1 of
27 articles was cross-posted. I was certain, too, that a lot of the
articles I read in policy I had already read in misc. So certain, in fact
that I hadn't even counted them lately. I guess the demise of the
"open/closed repeater" flame wars had me fooled.

Since you've demonstrated (quite successfully) that I'm wrong, I withdraw
my opposition to the split. If it CAN be made to work, I'm for it.

473. 40M antenna question

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-07 01:47:43 UTC
From: mulvey@world.std.com
Message-ID: <C53BnL.3CJ@world.std.com>
Source record: 283630

Hello!
In anticipation of getting my Tech+ license in a few weeks, I'm starting to accumulate some equipment. I currently have an Oak Hill 40M QRP rig, and now I need to set up an antenna... the problem is that I live in a VERY small apartment, with no access to rain gutters, etc. for the typical "stealth" antenna. I can, however, get access to a long, 4ft. high wooden fence that is a few feet from my back window, so I was thinking of running a feedline out to it and putting a full-size dipole on the back side. :-) My question is: how badly will receiving/transmitting be affected with the antenna only 4' from the ground? The reason that I haven't actually *tried* it yet is because I have to drill a hole in a brick wall if I'm going to use this method. My second question is: Has anyone tried the MFJ "portable" antenna? Is it a reasonable alternative to the dipole? For that matter - does anyone have comments about other alternatives? Thanks for any help you can give me!

- Rich

WARNING: the comments that follow are from a non-DXer, a non-contester, etc.... (I do love to work DX when I find it, and I have worked contests, but only for fun, not for awards....my own self-satisfaction, and of course, the good/bad opinions on my latest odd-ball antenna design, are the most important reward for me.)

In article <1ppl9vINNr4c@hp-col.col.hp.com> bobw@col.hp.com (Bob Witte) writes:

[other attributions missing....someone else seems to have nuked them.]

>> > Wow. I've heard disagreement on what constitutes a legit contact
>> > before but this is the first time I've heard someone claim
>> > that you don't even have to copy the other station's callsign.

this statement, I'd have to go along with. if you didn't get the guy's call right, something's wrong. HOWEVER......

>> I guess if you get a QSL card from another ham and you find that you had
>> copied his call wrong, you would tear up his card and not respond? Sheesh
>
> I would tear up the card or send it back to him with "Not in Log"
> if he supplied with return postage or an SASE. And yes, I have done
> this.

that's a bit extreme, IMHO. while this doesn't apply for cw or other digital modes, for voice, it can be a problem. there are times when someone has a rather extreme accent, and copying a call, even when given phonetically under (honest) 59 conditions, can be a b*tch. for example, I've had a lot of problems copying Japanese calls, and they seem to have the same amount of trouble copying my call. I'm told that the different alphabets may be somewhat to blame for this (N5IAL always seems to turn into N5RAL).

of course, even on local 2m FM stuff, you'd be surprised at just how many times I'm called as N5AIL instead of N5IAL. I have no idea what causes that one...but it happens a lot.

if I got a QSL card (voice contact) with someone's call that didn't match something in the log, I wouldn't just turn around and get nasty about it...I'd look in the log to see if there was someone on that same frequency at that same time with a SIMILAR callsign, name, QTH, etc., and if so, I'd correct *MY* logbook and send a return QSL, perhaps with something like ``sorry, must have got the call wrong the first time around...got it corrected now, though). I do seem to recall this happening once, too.

of course, since I normally work AMTOR and PacTOR, this is pretty much a non-issue. back when I worked cw almost every minute (almost exclusively, in fact), I sometimes had problems with people who sent too many DITs, but I was usually on 30m (at that time, my definition of Heaven), and rarely (if ever) saw even this problem. I tend to stay away from the voice bands (except for listening to shuttle audio), due to all the trash that seems to be there (e.g., 14.313, is it?).

> No credible person talks about "working" someone when they haven't
> even copied the callsign! This ain't nitpickin'.

this is true...I agree completely. and I get really sick when I hear people on DX nets having to have the call relayed to them (things like ``the letter he/she said was between 'E' and 'G' '') from a third party somewhere. BUT, there's a big difference between that and just not hearing it right due to something like a thick accent (naturally, who has the accent and who doesn't depends on the observer).

478. Install PL in TH21AT ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-07 03:18:10 UTC
From: ahm@spatula.rent.com
Message-ID: <1993Apr7.031810.6118@spatula.rent.com>
Source record: 283690

With many of the local repeaters using PL, I need to install a
a tone board in my Kenwood TH21AT handie, and there's not much
space inside this shirt-pocket-sized unit.

I'm looking at the Communications Specialists SS-32SMP.
Has anyone installed one of these?

Also, the tone board seems to be programmed by soldering jumpers.
Is there some way to use an external switch to make it easier to
reprogram it ?

Thanks,
Andy

FROM ARRL HEADQUARTERS NEWINGTON CT
APRIL 6, 1993
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SB QST ARL ARLB037
ARLB037 FCC DENIES REQUEST

THE FCC HAS DENIED A REQUEST BY AN ATTORNEY FOR RICHARD A. WHITE
JR., KA3T, TO HAVE HIS RECORD OF CORRESPONDENCE WITH THE COMMISSION
WITHDRAWN AND EXPUNGED.

WHITE WAS ONE OF EIGHT PACKET BULLETIN BOARD OPERATORS TO RECEIVE A
NOTICE OF VIOLATION IN JANUARY, 1991, FOR FORWARDING AN ''ALL USA''
MESSAGE WHICH THE FCC CALLED A BUSINESS MESSAGE.

THE NALS REQUIRED THAT THE PBBS OPERATORS EXPLAIN THE CIRCUMSTANCES
OF THE VIOLATION AND DESCRIBE WHAT STEPS THEY WOULD TAKE TO PREVENT
FUTURE VIOLATIONS. WHITE, THROUGH HIS LAWYER, RESPONDED TO THE FCC,
WHO IN APRIL, 1991, SAID THAT NO FURTHER ACTION WOULD BE TAKEN AND
DROPPED THE 300 DOLLAR FINE AGAINST WHITE SINCE HE HAD STATED THAT
NO ''ALL USA'' MESSAGES WOULD BE SENT BY HIS STATION WITHOUT PRIOR
SCREENING TO ENSURE COMPLIANCE WITH THE RULES.

WHITE'S LAWYER SOUGHT TO HAVE THE CORRESPONDENCE BETWEEN WHITE AND
THE FCC REMOVED FROM HIS RECORDS BECAUSE NO ACTION AGAINST HIM
RESULTED, SAYING THAT HIS CLIENT WAS ENTITLED TO AN UNTAINTED RECORD
FREE OF ANY QUESTION CONCERNING THE OPERATION OF HIS STATION.

THE FCC ON MARCH 22, 1993, DENIED THAT REQUEST, CALLING IT
''UNWARRANTED.'' THE FCC SAID THAT IT DOES NOT CONSIDER A LICENSEE'S
FILE CONTAMINATED ''MERELY BY THE PRESENCE OF AN EXCHANGE OF
CORRESPONDENCE BETWEEN THE COMMISSION AND THE LICENSEE.''

THE FCC CALLED THE EXCHANGE BETWEEN IT AND KA3T ''FRUITFUL, IN THAT
IT SHOWS WHITE AS A LICENSEE WHO TAKES SERIOUSLY THE RESPONSIBILITY
FOR STATION CONTROL.''

Derek, its really senseless to start a new string on the thing. Whether
you do or dont send your own callsign, and whether he doesnt
send his makes no difference. Like you said, its all on the honor system
and if he logs the contact, whether its a DXpedition or not, and he makes
the contact in the "old" way or new way, he's still wrong. Simple.

JUST WHEN THE DXCC DESK THOUGHT THEY WERE CATCHING UP!

New qualifications of logging contacts, domestic or DX. You need not copy the callsign! Just dream it up, find them in the callbook and QSL them! Thats it! How hard can it be?

This is getting old fellas!

Charlie

Revision: 3.7 02/19/93 17:18:18

Rec.radio.amateur.misc Frequently Asked Questions
Part 1 - Introduction to the FAQ and Amateur Radio
------------------------------------------------------------------------------

This is a regular posting of frequently-asked questions (FAQ) about Amateur
Radio, also known as Ham Radio. It is intended to summarize some common
questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list
as well as to help beginners get started.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good
signal-to-noise ratio in the newsgroup. However, they can't do it alone - you,
the reader, have to use them. If you are a new user, please print and review
the FAQ articles and look at the instructions in the news.newusers newsgroup
before posting any articles. If you are an experienced user, please help by
refraining from answering frequently-asked questions on the newsgroup if they
are already answered by the FAQ articles. Instead, send e-mail to the user who
asked the question. (It will be helpful if you include the part of the FAQ
that answers their question, but not the whole thing.)

The FAQ cannot always prevent people from posting repetitive questions. But
even if hundreds of questions get posted, it saves you from having to answer
them hundreds of times. Also, a friendly pointer to the FAQ in your first
answer can help that person refer to the FAQ in the future. That is when we
can begin to get a real savings of network bandwidth.

To reduce the size of each article, the FAQ information is posted in 3 parts:
Part 1 - Introduction to the FAQ and Amateur Radio
Part 2 - Amateur Radio Organizations, Services, and Information Sources
Part 3 - Amateur Radio Advanced and Technical Questions

Table of Contents
-----------------
Dates indicate last modification.

Part 1 - Introduction to the FAQ and Amateur Radio
** Table of Contents (1/93)
** Introduction to the FAQ (11/92)
* How to Contribute to the FAQ Articles (1/93)
* Acknowledgements (7/92)
* Notes on "Netiquette" (1/93)
```

** What is Amateur Radio? (11/92)
** Who can become a ham in the United States? (11/92)
** Where can I locate information and books on Amateur Radio? (4/92)
** How much does it cost? (4/92)
** Where can I take the tests? (pre-4/92)
** What are the tests like? (4/92)
** What can I do with a ham radio license? (5/92)
** What can't I do with an Amateur Radio license? (pre-4/92)
** I'm interested, who will help me? (11/92)
** Should I build my own equipment or antenna? (11/92)

Part 2 - Amateur Radio Organizations, Services, and Information Sources
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (new 1/93)
* The ARRL e-mail server (1/93)
* The Internet File Transfer Protocol (FTP) (1/93)
* Access to FTP archives via electronic mail (1/93)
* The Info-Hams mail list: rec.radio.amateur.misc by mail (1/93)
* Telephone BBS's with Ham-related information (11/92)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (11/92)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (1/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (pre-4/92)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (4/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

Part 3 - Amateur Radio Advanced and Technical Questions
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** I'm confused. What do all those abbreviations mean??? (5/92)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(4/92)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another

country (on vacation)? (11/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (pre-4/92)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (4/92)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 1--

** Introduction to the FAQ

* How to Contribute to the FAQ Articles

We accept suggestions from the Amateur Radio community. Please
consider the following criteria:
- is it a commonly asked question?
- will its inclusion help reduce the usage of network bandwidth?
- how useful is it to beginning Hams or to the majority of Hams?
Contributions don't have to meet all of these but the minimum is one.
We actually only ask that you consider these before contributing.

We can't necessarily include every question or every topic - the
network simply doesn't have enough bandwidth to carry that much
information. Besides, the point is that we're trying to conserve
network bandwidth. You can find the locations of much more informa-
tion by referring to the "Index to the rec.radio.amateur.* Supple-
mental Archives" posted monthly by Paul Schleck KD3FU.

If you suggest a question for this FAQ, please include the answer.
You'll get credit for your contribution and you'll speed up the pro-
cess of getting the information ready for distribution.

If you feel your contribution is sufficient to meet the considerations
shown above, send it to hamradio-faq@amdahl.com so that it will
reach all the FAQ coordinators: (listed in alphabetical order)

Diana L Carlson KC1SP dls@genrad.com (Hudson, NH, USA)
Ed Hare KA1CV ehare@arrl.org (Newington, CT, USA)
Ian Kluft (editor) KD6EUI ikluft@uts.amdahl.com (San Jose, CA, USA)
Michael Larish KD6CTZ nomad@ecst.csuchico.edu (Chico, CA, USA)
Paul Schleck KD3FU pschleck@unomaha.edu (Omaha, NE, USA)
Chris Swartout N6WCP cas30@uts.amdahl.com (San Jose, CA, USA)

Rosalie White WA1STO rwhite@arrl.org (Newington, CT, USA)
Derek Wills AA5BT oo7@astro.as.utexas.edu (Austin, TX, USA)

* Acknowledgements

All questions listed as modified "pre-4/92" are entirely Diana Carlson's work or her editing of a contributor's work. Diana established this FAQ. She is now one of the larger group that maintains it but we didn't want her effort to be lost in the crowd.

* Notes on "Netiquette"

The rec.radio.amateur.misc newsgroup and Info-Hams mail list have a large daily volume of traffic. They can operate more efficiently if the following netiquette guidelines are followed. Please take them seriously.
* If you are new to UseNet, the introductory articles in news.announce.newusers are required reading. Go to that newsgroup now.
* When posting a followup article, ALWAYS try to minimize the number of lines of quoted material from the original article.
* As a general rule when you try to determine whether to reply to someone by e-mail or with a followup article, remember to "praise in public, criticize in private." It's OK to disagree technically but be careful not to attack the person with whom you disagree. Also, be careful with your use of the word "you" when posting a follow-up article. Many unnecessary flame wars have started that way.
* Use a descriptive subject. For example, a message subject of "Ham Radio" tells the reader NOTHING about the contents of your article since the whole newsgroup is about Ham Radio. Other examples of subjects which are so broad that they become useless could include, "Help," "A Question," "Antennas," or "Frequencies." Maybe "Books on Antennas?" or "Where can I find Repeater Frequencies?" would be better, for example. Remember, in a busy newsgroup a lot of users decide which articles to read from the subject line alone. If you post, don't deprive yourself of an audience!
* Before answering a question, check if the FAQ adequately answers it or if someone else already answered it. If you have more to add, make sure to reference either the FAQ or the related articles.
* If a user posts a question which is directly answered by the FAQ, there is no need to post an answer - the information is already available on the newsgroup. Instead, just send an e-mail message which politely explains where to find the FAQ. They will probably appreciate it if you include the answer to their question. (Don't send a "nastygram" - that would just discourage future participation.)
* Pay attention to the size of your audience - use the "Distribution:" header. If you leave it blank, your message will go to every civilized country in the world and occupy disk space in all news systems in all those places. If that's what you intend, that's fine but make sure your article is relevant outside your country. (In

particular, Hams should already know there is more to the world than just their own country.)
* If you have an item for sale, please limit the distribution area so that, for example, an article about a radio for sale in New Jersey won't get to California or Europe. If you wish, you may cross-post your for-sale article to rec.radio.swap.
* Software sources should be posted to either alt.sources, comp.sources.misc, or comp.sources.* for a specific machine type. Software binaries should be posted to the appropriate subgroup of comp.binaries.

** What is Amateur Radio?
Amateur Radio is a non-commercial radio communication service whose primary aims are public service, technical training and experimentation, and communication between private persons. Amateur Radio operators are commonly called hams. Hams often communicate with each other recreationally but also provide communications for others at public events or in times of emergency or disaster.

** Who can become a ham in the United States?
Anyone who is not a representative of a foreign government can be an Amateur Radio operator in the USA. There are tests that you must pass to get a license, however the tests are not insurmountable.

** Where can I locate information and books on Amateur Radio?
Your local Radio Shack sells some ham radios and Amateur Radio license books. Books can also be obtained through the mail from ham radio organizations, such as ARRL in Newington, CT (203-666-1541) and W5YI in Dallas, TX (1-800-669-9594). There may be one or two ham radio stores in the local area (ie, within 50 miles). Try looking in the Yellow Pages under Radio Communications.

For the Novice license, get a Novice License manual, plus 5-word-per-minute Morse code tapes, costing around $25. For the Technician license, get a combined Novice and Technician License manual, and an FCC Rules manual, costing around $32. The FCC Rules manual is a good idea for Novice also, but not necessary, since the Novice License manual contains all the FCC Rules that are required for the Novice License.

The ARRL Education Activities Department has several programs to help amateurs (or prospective amateurs) to get started. Ask for a "New prospect package" available free of charge, from ARRL HQ, Educational Activities Department, 225 Main St, Newington, CT 06111.

** How much does it cost?
To take the Novice tests, it's free. To take the Technician or higher class tests, there is a small charge (around $5-$6 currently) to cover copying costs and running the testing sessions. The cost of a radio is really dependent on what you want to do. You can make your own radio and antenna for under $150. You can buy a used

single-band radio for $150-$300. Or you can buy a new multi-band multi-mode radio with all the doodads for $300-$3000. I'd suggest you learn more about ham radio, talk to local hams, find out what you want to do with ham radio first.

** Where can I take the tests?
The Novice tests can be given by any two qualified hams of General class license or above. The Technician tests and all higher class license tests are given by three qualified Volunteer Examiners (VEs) who volunteer their time.

To locate an ARRL testing session in your area, you can contact ARRL at 203-666-1541 x282.

** What are the tests like?
First off, come prepared to VE sessions. Bring: TWO forms of ID, one of which has a picture on it; a calculator (if necessary); a pen and two pencils; the applicable examination fee (around $5-$6 for 1992); the original AND a copy of your current Amateur Radio license (if you have one); the original AND a copy of any CSCEs for tests you've already passed (if you have any).

Each of the written tests (Novice, Technician, General, Advanced, and Extra) are generally a multiple choice test of approximately one-tenth of the question pool. For example, if the question pool is approximately 300 questions, then the test will be a 30-question test. You need to get 75% correct to pass. Note that they truncate to determine the correct number of questions. That means for a 30 question test, you need to get 22 right, which is actually only 73.3%.

Once you've paid the small fee for Technician-Extra tests, it costs no extra to take another test, so I'd suggest you keep taking the next more advanced test until you fail. If you pass the written but not the Morse code (or vice versa) for a specific class license, you have up to one year to take the other test before you would have to retake the written test again. Note that some VEs will not allow you to take the written test unless you've first taken the Morse code test.

The Morse code test is a receiving test only. The test run 5 to 7 minutes. After the test, you are given a 10-question multiple-choice or fill-in-the-blank test. Passing grade is 7 or more. If you fail the 10-question test, the examiner team will examine your copy sheet to see if you have 1 minute of solid copy with no errors. For 5 wpm, that's 25 characters, for 13 wpm, that's 65 characters, for 20 wpm, that's 100 characters. If they can find 1 minute solid copy, you've still passed.

Hints on Morse code tests: Generally, it will be a standard QSO (conversation), and it MUST contain at least one of each of the following:
26 letters A-Z, 10 numbers 0-9, comma (,), period (.), slant or

slash (/), question mark (?), double dash prosign (BT), end of message prosign (AR), end of contact prosign (SK).
The letters count as one character, all others count as two characters. There are a couple other prosigns which are worth knowing, but will not be on the test, like "I'm done talking, next" is K, "I'm done talking, back to you" is KN, "Please wait" is AS.

** What can I do with a ham radio license?
There are so many things, it's a difficult question to answer, but here's some ideas:
* Talk to people in foreign countries.
* Talk to people (both local and far away) on your drive to work.
* Help in emergencies by providing communications.
* Provide communications in parades or walkathons.
* Help other people become hams.
* Hook your computer to your radio and communicate by computers.
* Collect QSL cards (cards from other hams) from all over the United States and foreign countries and receive awards.
* Participate in contests or Field Day events.
* Provide radio services to your local Civil Defense organization thru ARES (Amateur Radio Emergency Service) or RACES (Radio Amateur Civil Emergency Service).
* Aid members of the US military by joining MARS (Military Affiliate Radio System).
* Participate in transmitter hunt games and maybe build your own direction-finding equipment.
* Have someone to talk to on those sleepless nights at home.
* Receive weather pictures via satellites.
* Build radios, antennas, learn some electronics and radio theory.
* Talk to astronauts in space, or use the moon to bounce signals back to people on the Earth.
* Experiment with Amateur TV (ATV), Slow-Scan TV (SSTV), or send still-frame pictures by facsimile.
* Experiment with amateur satellite communications.

** What can't I do with an Amateur Radio license?
The most important thing you can't do is transact business of any kind over ham radio. Interference to other hams or services, as well as obscene, profane or indecent language is not tolerated and is illegal. Music and broadcasting are not allowed on ham radio. Some personal conversations may not be appropriate to Amateur Radio. Do you really want the whole world to hear about Aunt Mabel's hemorrhoids?

** I'm interested, who will help me?
There are hams who are willing to become "Elmers" (mentors, helpers) in your local area. Look around and ask local hams. Search out local radio clubs. As well, some people have volunteered to be an Elmer over the Usenet. A list of UseNet Elmers and their e-mail addresses is posted to the newsgroup monthly. If anyone wants to be an Elmer, send e-mail to

elmers-request@unomaha.edu

** Should I build my own equipment or antenna?
"Homebrewing" is a fun and educational part of ham radio. It is a thrill to build your own transmitter and put it on the air. However, building your own receiver can be quite complicated; if you don't have electronics experience, you may want to buy a receiver instead. Most homebrew transmitters are QRP (transmit very low power). That's fine for an experienced ham with a very good antenna, but a Novice ham will just get frustrated. Your first rig, therefore should NOT be a home-brew.

Antennas can be much simpler projects than the transceiver, though some types are also quite involved. Most hams build their own antennas for base station use and buy antennas for mobile (car) use. Most beginner ham books describe how to build different types of antennas. Order of difficulty, from easiest to more difficult, for some common antennas are: wire dipole, Zepp, Yagi, Quad, and Log-Periodic. Books from many sources, including ARRL and several Hams, discuss antennas in depth.

When building or even understanding antennas, it is good to know the relationship between the antenna element length and the frequency or wavelength it is designed for. An antenna performs best at multiples of 1/4 of that wavelength, though 5/8 wave also has beneficial qualities. The wavelength is related to the frequency with the following formula:

wavelength (in meters) = 300 / frequency (in megahertz)

You do not need a huge antenna or tower like ones you may see around your neighborhood. Large beam antennas and 40-foot towers are very expensive. As a beginner, a simple dipole antenna is perfectly adequate. As you gain experience (and money :-), you may want to invest in something bigger.

If you can afford new rigs and antennas, there are many mail order stores that advertise in ham radio magazines. If you want to buy a used rig, the best place is at a "hamfest" (ham flea market). You should take along an experienced ham, since some of the used equipment may be inoperative, overpriced or poor quality. You can also answer ads in ham magazines or posted at ham radio stores, although often, by the time you call, the equipment has already been sold.

Rec.radio.amateur.misc Frequently Asked Questions
Part 2 - Amateur Radio Organizations, Services, and Information Sources
------------------------------------------------------------------------------

Questions discussed in Part 2: (dates indicate last modification)
** Where can I find Ham Radio information with a computer? (11/92)
* The rec.radio.* newsgroups (new 1/93)
* The ARRL e-mail server (1/93)
* The Internet File Transfer Protocol (FTP) (1/93)
* Access to FTP archives via electronic mail (1/93)
* The Info-Hams mail list: rec.radio.amateur.misc by mail (1/93)
* Telephone BBS's with Ham-related information (11/92)
* Callsign servers and geographical name servers (11/92)
* FTP access to FCC Part 97 and FCC Amateur Radio question pools (11/92)
* Lists of radio modifications and extensions (11/92)
** Can I send ARRL or W5YI electronic mail? (11/92)
** "Why doesn't the ARRL do...?" (11/92)
** What magazines are available for Ham Radio? (pre-4/92)
** How do I use the incoming and outgoing QSL bureau? (11/92)
** Are there any news groups for CAP? (11/92)
** What's the name of the QRP club that issues QRP numbers? (pre-4/92)
** How do I become a 10-10 member? (pre-4/92)
** How do I join MARS? (1/93)
** How do I join RACES? (pre-4/92)
** What organizations are available to help handicapped hams? (pre-4/92)
** I am looking for a specific ham, can anyone help me find him? (pre-4/92)
** Can I post my neat new ham related program on rec.radio.amateur.misc?
(pre-4/92)
** Where can I get ham radio software for my computer? (4/92)
** Are there Dialup News services or BBSs for Amateur Radio? (4/92)
** Where can I find VE sessions in my local area? (6/92)
** Why isn't XXX available electronically? (4/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 2--

** Where can I find Ham Radio information with a computer?
This question has many answers spanning several electronic media
including UseNet, electronic mail, the Internet, dialup bulletin board
systems (BBS) and others. Various electronic information sources are
summarized under the subheadings that follow.
```

All electronic mail addresses listed are in Internet format. If your site is not connected to the Internet and does not support Internet-style mail addresses, you will need to contact either your system administrators or a local "guru" to find out how or if you can send mail to the sites listed. Ask them, "how can I get mail to the Internet?" and show them the address you're interested in.

* The rec.radio.* newsgroups
The primary distribution mechanism for this FAQ is UseNet. There are several newsgroups dealing with Amateur Radio and other aspects of radio. The full list is as follows:

rec.radio.amateur.misc (*) Ham Radio - misc/general topics
rec.radio.amateur.packet Ham Radio - computer/packet radio
rec.radio.amateur.policy Ham Radio - policy & regulation
rec.radio.broadcasting public broadcast radio
rec.radio.cb Citizens' Band Radio
rec.radio.info (*) periodic info from all rec.radio groups
rec.radio.noncomm misc non-commercial radio topics
rec.radio.shortwave Shortwave Radio
rec.radio.swap radio equipment wanted and for sale

This FAQ is cross-posted to the newsgroups marked with asterisks (*). It is also cross-posted to rec.answers (the archive for FAQs in the rec.* newsgroups) and to news.answers (UseNet's general repository for FAQs.) These should be the first places to look for new current copies of the FAQ.

Most of the rec.radio newsgroups have their own FAQs as well.

* The ARRL e-mail server
ARRL is the American Radio Relay League, representing and promoting Amateur Radio in the USA. They have established an automated file server which responds to information requests via electronic mail. To use the server, send mail to info@arrl.org with any number of one-line commands in your message. Valid commands are as follows:

help sends more detailed instructions about the e-mail server
index sends a list of the files currently available
send file sends a file (replace "file" with the file's name)
several files are referenced by name in parts of this FAQ
quit ends command processing - use it if a signature will be appended to your message

The server program will respond to the commands, each in a separate message. Among many other informative files, a current copy of the FAQ (updated monthly) can be obtained from the ARRL e-mail server.

* The Internet File Transfer Protocol (FTP)
Sites connected to the Internet can access large amounts of data almost anywhere in the world, often at high speeds. One common way to transfer the data you want is FTP. Some sites offer a service called "anonymous FTP" which allows remote users to access a set of public files without requiring a password.

Tom Czarnik coordinates a fairly definitive list of anonymous FTP sites, their IP numbers, time zones, general contents, and access policies which he posts to the comp.misc, comp.sources.wanted, alt.sources.wanted, and news.answers newsgroups. It is itself available via anonymous FTP (how about that?? :-) from (among other places) rtfm.mit.edu (18.172.1.27) under directory /pub/usenet/news.answers/ftp-list.

For specific information about exact locations of files by name, the Archie database server may be of help. First check if anyone has installed the "archie" program on your machine and use it. Archie may also be accessed by telnetting to one of the following sites (use the one closest to you):

Finland/Europe: archie.funet.fi (128.215.6.100)
Canada: archie.mcgill.ca (132.206.2.3)
Australia/New Zealand: archie.au (128.184.1.4)
Israel: cs.huji.ac.il (132.65.6.5)
UK/Ireland: raquel.doc.ic.ac.uk (146.169.11.3)
USA (Maryland): archie.sura.net (128.167.254.179)
USA (Nebraska): archie.unl.edu (129.93.1.14)
USA (New York): archie.ans.net (147.225.1.2)
USA (New Jersey): archie.rutgers.edu (128.6.18.15)

Login is archie. Type "help" at the prompt for a description of all server commands.

For those without telnet capability, the database may be accessed non-interactively via mail server. Send E-mail with the word "help" to archie@host where host is one of the Archie sites above.

The above two resources (the FTP list and the Archie server) are extremely powerful tools for finding out "what's out there" at various FTP sites around the world. *PLEASE* exhaust their capabilities before posting requests to the net.

The following is a brief summary of major ham-related FTP sites and places where you can obtain a current copy of this FAQ:

ftp.cs.buffalo.edu (128.205.32.9)
(submissions to this ftp site should be made to bowen@cs.buffalo.edu) - contains many ham radio files, including the FAQs, Elmer list, SWL and scanner info, Packet FAQ, examination opportunities, information on various regulations, information on commercial radios (i.e. GE or Motorola), SSTV (slow-scan TV), HTs (handheld transceivers) and the KA2UGQ worldwide BBS list. See ~pub/ham-radio. This FAQ is updated monthly here.
wsmr-simtel20.army.mil (192.88.110.20)
Keith Peterson, W8SDZ, has apparently returned as the maintainer of this huge repository of ham-radio (software and modifications), MS-DOS, and CP/M files. To find out how to submit files to this archive, please read his informational

posts to the comp.binaries.ibm.pc.archives newsgroup. If you
cannot directly FTP from wsmr-simtel20, there is a mail server
that can help. Send mail with the text "help" to
listserv@vm.ecs.rpi.edu (128.113.5.11).
wuarchive.wustl.edu (128.252.135.4)
A "mirror" of the files available on Simtel20, plus a *LOT*
more. A more user-friendly Unix environment (plus a faster
net connection) makes this site preferred over Simtel20.
If you are on a Unix box locally, see if your system
administrator will "NFS-mount" these files for faster/easier
access.
ucsd.edu (128.54.16.1)
The "home" site (with the most recent versions for the largest
number of different computer platforms) of the KA9Q TCP/IP
Network Operating System (NOS), other ham-related software,
and the archives for the Info-Hams, Packet-Radio, Ham-Policy,
Radio-Info and TCP-Group digests.
uxc.cso.uiuc.edu (128.174.5.50)
cd pub/ham-radio - This site contains the HyperCard Hamstacks
written by Diana Syriac as well as ASCII readable ham radio
question pools.
ftp.apple.com (130.43.2.3)
cd pub/ham-radio - Ham software and information, especially
Macintosh software
ftp.uu.net (137.39.1.9)
wuarchive.wustl.edu (128.252.135.4)
wolfen.cc.uow.edu.au (130.130.68.4)
athene.uni-paderborn.de (131.234.2.32)
nic.funet.fi (128.214.6.100)
ham radio files and software for the Amiga computer system
rtfm.mit.edu (18.172.1.27) also called pit-manager.mit.edu
cd pub/usenet/news.answers - all participating FAQs and
periodic informational postings are archived here, including
those from the rec.radio.* newsgroups which can be found in
pub/usenet/news.answers/radio. Participating FAQs are
automatically archived here when they are posted on UseNet.
uts.mcc.ac.uk (130.88.200.3)
cd gopher-data/justforfun/faq/recreation - see *radio* for
radio-related FAQs. This site is located in the UK and is
a good place to obtain the FAQ from the UK and the European
mainland.
ftp.amdahl.com (129.212.11.1) also called charon.amdahl.com
cd pub/radio/amateur - the most up-to-date copy of the FAQ
(updated nightly when changes are made)

If you experience difficulty connecting to the above FTP sites, some
troubleshooting hints are shown below. The unfortunate situation here
is that Netnews is far more prevalent than direct Internet hookups,
accurate name servers, smart mailers and routers, and of course,
telnet and FTP client services. What this means is that your trouble

may be caused by MANY factors.

Here's some hints to check what's wrong:
* It may very well be that your newsfeed and email are via dialup line and UUCP (Unix-to-Unix copy) in the wee hours of the morning. If this is the case, then you have no direct connection to the Internet and thus cannot use real-time interactive services like FTP and telnet.
* If you are at a college or university, your host (ie, the computer you are logged onto) may be on the Bitnet network, which has an email gateway to the Internet, but no direct connect capability.
* If you do have a direct connection to the Internet, does your host have telnet and/or FTP client programs? (ie, if you type "ftp" or "telnet" at your command prompt, do you get anything?) Many hosts, particularly IBM mainframes not running Unix, do not support these services!
* Can you telnet to other hosts and get a login prompt?
It may very well be that some hosts are "not recognized" due to misconfigured connections and inaccurate host tables/name servers (*.mil computers are *NOTORIOUS* for this!)
* If you get "host not in host table" or "host unknown" or similar error, try telnetting via the IP number, a set of four 1-3-digit numbers separated by periods (eg, 137.48.1.1). The exact IP number for the site can be obtained via the nslookup utility, if your computer supports it....or check the FAQs. Your host may not recognize the "fully-qualified domain name" (like callsign.cs.buffalo.edu), but it should ALWAYS recognize an IP number if their network is reachable from yours.
* If you get "network unreachable" check with some more knowledgeable users if your site is actually connected to the Internet. If it is, a link in the network may be temporarily disconnected for maintenance (or by accident.)
* In the case of telnetting to a non-default port (as in the case with the callbook servers), if telnet <host> <port#> doesn't work, but you can telnet to the default login port (ie, no qualifiers), then the manner at which the port qualifier is entered may be system dependent.
* Syntax for telnetting from different operating systems differ.
Some common command syntaxes are: (angle brackets are for readability, do not type these in literally)
Berkeley Unix or VMS with Wollongong TCP/IP uses syntax:
telnet <host> <socket#>
Other possibilities to try:
telnet console <host> (for 2000 port)
telnet <CR> open <host>:<port#>
telnet <host>/<port#>
telnet <host>/port=<port#> (for Multinet on VMS)
* Compression techniques are different for different operating systems.
However, these hints should help: foo.sit needs MacIntosh UnStuffit to unstuff; foo.hqx needs MacIntosh BinHex to uncompress; foo.Z

needs Unix 'uncompress' to uncompress or VMX compress_vms.exe (on gatekeeper.dec.com) will work too. If more than one method was used, like for foo.hqx.Z, start at the outside and work in (so uncompress on Unix with 'uncompress' first, transfer to MacIntosh, then uncompress with BinHex to get uncompressed file).
* There is an excellent introduction to FTP and archiving software regularly posted to comp.binaries.ibm.pc and news.answers.
* If all else fails, ASK your system administrator or check system documentation.

* Access to FTP archives via electronic mail
ANY BITNET, EARN, or NorthNET site can access the Princeton mail server. It will be most efficient if you know the complete path and filename for anything you wish to transfer, but you can use 'cd' and 'ls -l' commands to move about and browse the remote site's directories. The Archie database server may also be useful to search for files and their directory locations on FTP sites around the world (see below). Please be patient when using non-interactive mail servers such as BITFTP as each request may take several hours (or longer) to be fulfilled.

For access to the FTP server, send email to bitftp@pucc.bitnet (for BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter. The text of the email is the FTP commands one after another. For example, suppose you wanted to access the FTP site lcs.mit.edu:
FTP lcs.mit.edu
USER anonymous
PASS yourname@yoursite (not required)
ASCII
CD telecom-archives
GET filenames
BYE
A help file is available giving detailed instructions by putting the single word HELP into the text of the email.

For nonBITNET users, there is also a FTPMAIL server at ftpmail@decwrl.dec.com (16.1.0.1). Commands include: REPLY <mailaddr>, CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS, COMPACT, UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>, QUIT, HELP. Get the help file for more information by sending mail with the single line "help". The ftpmail site may complain if you try try to get more than 1 file per email request. Here is an example of a request:
reply your_name@your_site
connect uxc.cso.uiuc.edu
binary
uuencode
get pub/ham-radio/Tech.v3.3.sit.hqx.Z
quit

A note on the use of FTP mailservers: If you want to use FTP mailservers, like FTPMAIL, please be considerate of any systems that your mail must pass through. The quickest way to find yourself cut off from the world is to make the admins of sites that pass your mail pass 60Mb of X11 graphics system source. If you need large amounts of information from a mailserver, contact your admin for help -- it may already be available, or he may know a better way to get it.

* The Info-Hams mail list: rec.radio.amateur.misc by mail
You can use rec.radio.amateur.misc even if your site has no NetNews feed. To subscribe to rec.radio.amateur.misc, send email to:
Info-Hams-Request@ucsd.edu
In the body of the message, write:
subscribe Info-Hams
If your local e-mail software does not provide a valid return address (i.e. Bitnet, many Milnet sites, and many non-Unix e-mail packages) you can provide your return address between the "subscribe" and the name of the mailing list (i.e. "subscribe myname@here.org Info-Hams".)

Similarly, to subscribe to some other rec.radio.* newsgroups, use the following directions:
* To subscribe to rec.radio.amateur.packet, send email to Packet-Radio-Request@ucsd.edu, message is "subscribe Packet-Radio"
* To subscribe to rec.radio.amateur.policy, send email to Ham-Policy-Request@ucsd.edu, message is "subscribe Ham-Policy"
* To subscribe to rec.radio.info, send email to Radio-Info-Request@ucsd.edu, message is "subscribe Radio-Info"
* To subscribe to rec.radio.shortwave, send email to listserv@cuvma.columbia.edu, message is "subscribe swl-l (your name)"

TO UNSUBSCRIBE, follow directions above, changing the command word "subscribe" to "unsubscribe"
DON'T POST TO THE NEWSGROUP ITSELF! USE THE REQUEST ADDRESS!
Help is available by using the command word "help". Note that command words MUST be the first word on each line of the message.

You can post to rec.radio.amateur.{misc,packet,policy} by sending your posting email to Info-Hams, Packet-Radio, or Ham-Policy, all at ucsd.edu. Since rec.radio.info is a moderated newsgroup, requests to post to it may be sent to Radio-Info but they will be mailed to the moderator, rec-radio-info@ve6mgs.ampr.ab.ca, for posting.

All of the Amateur radio newsgroups are archived for FTP on ucsd.edu under subdirectory mailarchives/{Ham-Policy, Info-Hams,Packet-Radio}. Radio-Info is not archived at UCSD. (See the news.answers archives at rtfm.mit.edu.)

* Telephone BBS's with Ham-related information
WB3FFV has one, phones are 301-625-0817 or 301-625-9482 or 301-625-9663. Data settings are 8 bits, NO parity, 1 stop bit.
Login is bbs, no password.
This BBS is also available via UUCP, login is uucpanon, no password.
For a listing of available archived, try:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

Another one is N8EMR at phone 614-895-2553, login hbbs. Data settings
are 8 bits, NO parity, 1 stop bit. N8EMR has a comprehensive list of
other ham-related BBS's on-line.

* Callsign servers and geographical name servers
If you are at an Internet site you can connect using telnet to one
of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.2)
ham.njit.edu (currently 128.235.1.10)

There is also a general geographical name server at:

martini.eecs.umich.edu (currently 141.212.100.9)

The callbook servers sit on port number 2000 and the geographical
name server sits on port 3000. These are different port numbers
than what telnet usually defaults to. So if you just telnet to these
machines, you will get a login prompt instead of the server. How you
tell your telnet program to connect to port 2000 or 3000 instead of
the default port is operating system dependent but it is usually done
with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, check the telnet/FTP troubleshooting hints
above or consult your local systems guru for the proper command string.

The interactive servers are designed to be somewhat self-explanatory
and they support fairly detailed help facilities. The first command
you should execute when connecting to one of these servers is "info".
This will list general info about that server and how to use it. You
should then type "help" to list the various commands available.
Typing "help" followed by a command name will give you a little more
detail about that command. Servers allow searches by call, last name,
zip code or city and also provide regular expression filters to trim
your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty
Carruth, N7IKQ. This database currently contains US and Canadian
callsigns and it does not contain club calls. A new version of the
database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com
(The UUCP address is ...!uunet!dptspd!callbook). In the body of the
text, say "lookup" followed by callsigns you want to look up. If
your mailer appends signature files, you should put a line "quit" at
the end of your request (before the signature file). If you want
help, put the word "help" on a line by itself. Here is what a
request might look like:
help
lookup kc1sp wn4bbj

lookup n0fzd
quit

There is another email callsign server at callbook@n8emr.cmhnet.org.
The subject line is the list of callsigns to lookup. All other lines
are ignored. This same callsign server can be accessed with packet
radio via cbook@n8jyv.#cmh.oh.usa.na. The body of the message should
include "REPLY n8jyv!HOME_BBS!CALL" (where HOME_BBS is YOUR home BBS,
and CALL is YOUR callsign), carriage return, "CALL call1 call2 ..."
(where call1 call2 .... is space separated list of callsigns you want
to lookup).

If you are a packet radio station, callserver data is available from
REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns,
separated by spaces. For Canadian calls, use the callserver at
REQQTH@VE3JF.ON.CAN. Body of message is ignored. The server is an
OS interface to the MBL packet BBS using the Buckmaster CD-ROM
callsign database.

The REQQTH address is for the AX.25 radio-linked amateur packet
network, *NOT* the Internet. If you attempt to send Internet mail to
this address, and use the old .NA suffix instead of the new .NOAM
suffix, it will get routed to Nimibia (Internet suffix .na) which is
currently paying a lot of money for misdirected ham mail. Help
maintain a positive example for amateur radio and please do not
attempt this!

The FCC "call sign hotline" at 717-337-1212 is available for those
who wish to listen to the call signs allocated in each group for each
district. This requires only a touch-tone telephone to use.

* FTP access to FCC Part 97 and FCC Amateur Radio question pools
Part 97 is part of the FCC regulations and only applies to the USA.

The text to part 97 is available by ftp from several locations:
Western US
ftp.amdahl.com /pub/radio/amateur/part97.txt.Z
Central US
pacific.mps.ohio-state.edu /msdos/ham/part97.arc
Eastern US
gandalf.umcs.maine.edu /pub/ham-radio/part97.txt
ftp.uu.net /networking/ka9q/part97.arc
The *.arc files are MSDOS ARC files with the same ASCII text.

An ASCII copy of the question pools are available by ftp from
uxc.cso.uiuc.edu (128.174.5.50) in /pub/ham-radio/<class>-pool.txt.Z,
where <class> is novice, technician, general, advanced or extra.

* Lists of radio modifications and extensions
Some mods can be found on wsmr-simtel20.army.mil or
the Simtel20 mirror directories on wuarchive.wustl.edu.

There is a new server at pcserver@novell.business.uwo.ca. Some
examples of main body email requests are as follows:
HELP
SENDME RADIO MODS
SENDME TH215 MODS
SENDME ALLBAND MODS

There is a packet radio Mods Server. To get the directories, send
a packet as follows:
SP REQFIL@N2IMC.NJ.USA.NA
Subject: MODS\Dir.1
/EX
To get the mod, send to same place, with Subject MODS\Filename.ext.

REMEMBER that any modification is likely to void your warranty and
that these mods are NOT guaranteed to work. This list is supplied
here because it is sometimes a frequent question on the newsgroup.

** Can I send ARRL or W5YI electronic mail?
Several ARRL HQ staffers can be contacted via the net. Their e-mail
addresses are available from the ARRL e-mail file server in the
file called "email". See above for more information on the ARRL
e-mail server.

ARRL requests that you include your postal address (the slow kind) in
case they need to send you nonelectronic material in answer to your
request.

W5YI, a large VEC, can be reached at the following address:
Fred Maia, W5YI 3511297@mcimail.com

** "Why doesn't the ARRL do...?"
If you want the ARRL to do something, tell them! Direct input from a
concerned member (or, actually, any concerned Ham) carries a lot more
weight than hearsay from any source. Their e-mail addresses are
available from the ARRL e-mail file server (see above). They want
direct input - that's why those addresses are available.

** What magazines are available for Ham Radio?
Your local ham store may have some, but here's some popular ones
(this is NOT a complete list!):
QST, ARRL, 225 Main St, Newington, CT 06111 - basic projects and
contesting
CQ The Radio Amateur's Journal, 76 North Broadway, Hicksville, NY
11801 - beginner ham radio articles
73 Amateur Radio Today, WGE Center, Forect Rd, Hancock, NH 03449,
FAX (603) 525-4423, email: COMPUSERVE 70310,775 or Internet
70310.775@compuserve.com - more technical ham radio articles
QEX, ARRL, 225 Main St, Newington, CT 06111 - more technical projects
WorldRadio, 2120 28th St, Sacramento, CA 95818, (916) 457-3655.
Subscriptions to 201 Lathrop Way, Ste D, Sacramento, CA 95815,
(800) 365-SUBS - lots of special interest columns, like QRP,
ATV, YL, etc.

W5YI Report, PO Box 565101, Dallas, TX 75356, 1-800-669-9594 -
up-to-date information on Amateur Radio happenings, including
VE information and statistics

** How do I use the incoming and outgoing QSL bureau?
To use the outgoing QSL bureau, you must be a member of ARRL. In general, you send a bundle of foreign (not States!) QSL cards to the outgoing bureau in Newington, Connecticut, along with a label off of your QST magazine (which shows ARRL membership), along with $2 per pound of cards (approximately 150 cards) or $1 for 10 cards or less.

To use the incoming QSL bureau, you do NOT have to be a member of ARRL. Send one or more Self-Addressed Stamped Envelopes (size 5x7 or 6x9, NO BIGGER, NO SMALLER) with one ounce of postage attached and with your callsign in 3/4" letters in top left hand corner where the return address label would go. If you expect a large quantity of foreign QSL cards, attach extra money or postage with a paper clip; do NOT affix extra postage to envelope. Send the envelopes to the QSL bureau for your callsign area. If your callsign is xx3xxx/5, you would send it to the 3rd call area, NOT the 5th call area. Addresses for QSL bureaus are listed in QST and on the ARRL e-mail server (see below); if you don't have access to a QST magazine, ask another ham. IMPORTANT: BE PATIENT! Turnaround time for a US QSL bureau, not considering foreign QSL bureaus, is about 3 months. Foreign QSL bureaus and hams can be as fast as 2 months or as slow as TEN YEARS, while average is about 6-12 months.

Addresses for the US incoming and outgoing QSL Bureaus are available from the ARRL e-mail server in the files called "qsl-in" and "qsl-out". See the question above

** Are there any news groups for CAP?
There is no news group just for Civil Air Patrol discussions. However, rec.aviation.misc is appropriate for CAP aviation discussions and for CAP radio information, these rec.radio.amateur.* groups are available. CAP-related files are also stored on the FTP site sunburn.cps.udayton.edu in pub/capital.

** What's the name of the QRP club that issues QRP numbers?
QRP Amateur Radio Club International, c/o Bill Harding K4AHK, 10923 Carters Oak Way, Burke, VA 22015.

** How do I become a 10-10 member?
10-10 is simply an organization to sponsor the use of the 10 meter band. It was first conceived when propagation was poor on 10 meters, as a method to get more hams to use 10 meters. The past few years have been great for 10 meters worldwide. However, "the bands are closing down" again, and 10 meters will once again be limited more for local communications, except for sporadic band openings, until the next sunspot cycle.

To join 10-10, work ten 10-10 members and LOG each 10-10 number, call sign, operator's name and location. Send the list to your numeric call sign or DX area manager (as shown below), with $5.00 U.S. new membership registration fee ($6.00 for foreign addresses).

10-10 International Area Managers:
USA 1 - Al Kaiser N1API, 194 Glen Hills Rd, Meriden, CT 06450
USA 2 - Larry Berger WA2SUH, 9 Nancy Blvd, Merrick, NY 11566
USA 3 - Chester Gardner N3GZE, 9028 Overhill Dr, Ellicott Cty,MD 21042
USA 4 - KY, TN, FL, VA, NC, SC only
Rick Roberts N4KCC, 7106 Ridgestone Dr,Ooltewah, TN 37363
USA 4 - GA, AL, Puerto Rico only
Jim Beswick W4YHF, 112 Owl Town Farm, Ellijay, GA 30540
USA 5 - Grace Dunlap K5MRU,* Box 445, LaFeria, TX 78559
*summer addr Jun-Oct Box 13, Rand, CO 80473
USA 6 - Dick Rauschler W6ANK, 4371 Cambria St, Fremont, CA 94538
USA 7 - Willie Madison WB7VZI, 10512 W Butler Dr, Peoria, AZ 85345
USA 8 - John Hugentober N3FU, 4441 Andreas Ave, Cincinatti, OH 45211
USA 9 - Jim Williams N9HHU, 240 Park Rd, Creve Coeur, IL 61611
USA 0 - Debbie Peterson KF0NV, RR 1 Box 35, Duncombe, IA 50532
All DX- Carol Hugentober K8DHK,4441 Andreas Ave, Cincinatti, OH 45211

** How do I join MARS?
To join MARS, you have to be 14 years or older (parental consent required under age 17), be a US citizen or resident alien, possess a valid Amateur Radio license, possess a station capable of operating on MARS HF frequencies, and be able to operate the minimum amount of time for each quarter (12 hours for Army and Air Force; 18 hours for Navy-Marines). Novices must upgrade to Technician within 6 months, else be dropped from MARS. No-Code Techs can apply, provided they have transmit and receive HF capability for MARS frequencies (they don't need transmit capability for Amateur HF frequencies). For application forms contact:

Chief, Air Force MARS
HQ AFCC/SYXR (MARS)
203 W. Losey St. Room 1020
Scott AFB, IL 62225-5219
(618)256-5552 Fax: (618) 256-5126

Chief, Army MARS
HQ, US Army Information Systems Command
ATTN: AS-OPS-OA
Fort Huachuca, AZ 85613-5000

Chief, Navy-Marine Corps MARS
Naval Communication Unit
Washington, DC 20397-5161

** How do I join RACES?
Contact your nearest Civil Defense or Emergency Management Agency. The Radio Amateur Civil Emergency Service is a part of a municipal, county, or state government. This does not mean, however, that

every such government has a RACES program. If your government does not have a RACES, ask them to refer you to the nearest jurisdiction that does have a RACES program.

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it thru 2155052@mcimail.com) and a book called "The ARRL Plan for the Disabled", available at no charge from the ARRL Regulatory Information Branch.

** I am looking for a specific ham, can anyone help me find him?
Rather than sending out a message on Usenet, you might first try directory assistance from the phone company or the locator service provided by the Salvation Army. A Salvation Army post in your local area may be able to help you. If you have his/her callsign or name, you might also try one of the on-line callservers shown above. Also, the Quarter-Century Wireless Assn maintains a collection of callbooks going back to "the beginning of time". Their address is: 1409 Cooper Drive, Irving, TX 75061. Also, the Callbook has a dial-in line for accessing new ham callsigns. Try (1-708-234-8011) at 2400 baud.

** Can I post my neat new ham related program on rec.radio.amateur.misc?
This is really not a good idea, since many of the readers receive these newsgroups as mail digests. Posting is also a one-shot thing. If you post and someone missed it, it is gone. A better way would be to announce the existence of your program here, along with information on how to obtain a copy of your program. You can also submit it to one of the FTP archive sites, which will allow the world to access it without you having to mail it to each requestor. If you just GOTTA post it somewhere, post it to more appropriate groups, like comp.sources.unix or alt.sources or comp.binaries.ibm.pc.

** Where can I get ham radio software for my computer?
Atari: John Adams KC5FW, 17106 Happy Hollow, San Antonio, TX 78232 "or tune into the weekly net Sundays 1600 UTC on 14.325 MHz".
MacIntosh: MacNet, John Seney WD1V 144 Pepperidge Dr, Manchester, NH 03103 (sent 2 800k FORMATTED diskettes, one of which contains a TEXT file containing your name, address, home PBBS, your radio & computer interests and equipment).

(See also the information about Anonymous FTP and ham-related telephone BBS's above.)

** Are there Dialup News services or BBSs for Amateur Radio?
There are two major news services for ham radio. Both are run by volunteer hams and provide bulletins of specific interest to amateurs,

hence they are perfectly legal to rebroadcast on ham bands according to FCC Regulation 97.111B(6). To lessen the load on the dialup lines, consider getting your local repeater operator to rebroadcast it, or tape record it to play at your favorite HF net.

RAIN (Radio Amateur Information Network) is produced by Hap Holly, KC9RP, located in Illinois. The news is typically updated 8am CST Fridays. Phone numbers are 1-708-299-INFO (299-4636) and 1-708-827-RAIN (827-7246).

NEWSLINE is another, produced by Bill Pasternak, WA6ITF. Donations for NEWSLINE are accepted at Newsline Support Fund, c/o Dr. Norm Chalfin K6PGX, Pasadena, CA 91102. Phone numbers are:
Chicago 1-708-289-0423
N.Florida 1-407-259-4479
West Palm Beach 1-407-965-1234
Los Angeles 1-805-296-2407 (Instant Update Line)
Los Angeles 1-213-462-0008
NYC 1-718-353-2801
Ohio 1-513-275-9991
Seattle 1-206-368-3969

** Where can I find VE sessions in my local area?
VE sessions are often announced in the local newspapers, but more often, they are announced by local radio bulletin boards. The local packet BBS will most likely have a monthly updated schedule for VE sessions. ARRL or W5YI can generally be called and asked for local VE sessions as well. Don't forget that you will need the following when you go in for an upgrade: a copy of your current Amateur license; your original Amateur license; any CSCEs (duplicate not required), if applicable and less than a year old; a picture ID, preferably a driver's license, passport or visa; and the VE test fee (approximately $5 right now).

Bart Jahnke, KB9NM, the ARRL VEC Manager (bjahnke@arrl.org) posts a definitive listing of VE exams indexed by state (and some overseas sites, usually at embassies and military bases) to the net every 6 weeks or so.

** Why isn't XXX available electronically?
This is a theme for a lot of common questions. For the "XXX" above, substitute any of the following:
Callbooks
DX QSL Lists
Radio station lists
ARRL publications (i.e. conference proceedings, repeater directory)
and more...

Except for the Callbook (via callsign servers), these are not available because of any of several reasons. Either there are copyright restrictions, royalty fees, or the source just may not have done the work. Also, not everyone that has information has reliable UseNet access.

In one example of someone's effort to bridge the information gap, there is a new repeater-mapping project which can automatically accept entries via e-mail. If you can get enough details about a repeater for a complete listing, you may want to help by submitting an entry. For more information, use the following e-mail addresses:

repeaters@wattres.sj.ca.us
Just send a message with only the word "help" in the message body. The project's software will reply with instructions.
steve@wattres.sj.ca.us
For other questions (Steve Watt KD6GGD)

As soon as the list is big enough to be useful, the project will make it available electronically. That will mean one less "why isn't it available electronically" question for the net.

492. rec.radio.amateur.misc Frequently Asked Questions (Part 3 of 3)

Newsgroup: rec.radio.amateur.misc

Rec.radio.amateur.misc Frequently Asked Questions
Part 3 - Amateur Radio Advanced and Technical Questions
------------------------------------------------------------------------------

Questions discussed in Part 3: (dates indicate last modification)
** What are the different US amateur classes and what can each of them do?
(pre-4/92)
** What is the best way to learn Morse Code? (10/92)
** What is the standard for measuring Morse code speed? (pre-4/92)
** I'm confused. What do all those abbreviations mean??? (5/92)
** What do all those "tones" mean? (pre-4/92)
** Where can I learn more about Amateur Radio if I live outside the US?
(4/92)
** How can I get a "reciprocal license" if I am a licensed ham from another
country or if I am a FCC licensed ham who wants to operate in another
country (on vacation)? (11/92)
** My apartment or housing complex does not allow outdoor antennas, now what
do I do? (pre-4/92)
** I got TVI...HELP!!! (pre-4/92)
** Did you know that you can get college credit for being a ham? (pre-4/92)
** On what frequencies do JPL and GSFC retransmit the shuttle audio?
(10/92)
** Can I take my HT on an airplane and operate it if I get the permission
of the captain? (4/92)
** How do I modify my current Amateur license? (4/92)
** I'm confused about XXX, should I ask the FCC? (4/92)
** Is there any information on antique radios? (pre-4/92)
** Where can I buy vacuum tubes? (pre-4/92)
** What do I need to get started in packet radio? (5/92)
** What do I need to get started in satellite communications? (pre-4/92)
** What is available to get started in ATV, SSTV and WEFAX? (5/92)
** What are these contests I sometimes hear, and how do I participate? (7/92)

--Rec.radio.amateur.misc Frequently-asked Questions------------------Part 3--

** What are the different US amateur classes and what can each of them do?
Novice - has CW (Morse code) privileges on 4 HF bands (80, 40, 15,
and 10 meter), Voice privileges on 10 meters, and privileges
on 2 VHF/UHF bands (220 MHz and 1290 MHz).
Required are 5 wpm Morse code test and 30-question Novice test.
```

Technician - has full privileges on all VHF/UHF bands above 30 MHz.
Required are Novice test and 25-question Tech test.
Technician may access Novice HF bands by passing the 5 wpm Morse
code test.
General - has all Technician privileges, plus larger access to more
HF bands, including CW and Voice on 160, 80, 40, 30, 20, 17, 15,
12, and 10 meter bands. A General class amateur can give Novice
tests.
Required are 13 wpm Morse code test, Novice, Tech and 25-question
General test.
Advanced - has all General privileges, plus wider band access on 80,
40, 20, and 15 meter bands. An Advanced class amateur can
also become a VE and give tests to Novice and Tech tests.
Required are 13 wpm Morse code test, Novice, Tech, General and
50-question Advanced test. The Advanced test is the most difficult
of the five written tests.
Amateur Extra - has full privileges on all amateur bands. An Extra
can become a VE and give all amateur tests.
Required are 20 wpm Morse code test, Novice, Tech, General,
Advanced and 40-question Extra test.

** What is the best way to learn Morse Code?
This is becoming an increasingly common question as many "no-code"
Technicians realize they can add more privileges to their license if
they learn Morse Code. The following list of suggestions should
be helpful in finding ways to approach the effort.

* Listen to code at a rate faster than you can copy.
* Participate in Novice-Roundup and/or Field Day. Practice whenever
you get the chance!
* Avoid the "deciphering" plateau around 5 WPM and and character
plateau at 10 WPM by listening to the fast Farnsworth-paced
"beat" of each letter and the "beat" of common words. (See the
question on Morse code speed for more information on Farnsworth
pacing.)
* Practice to develop a "copy buffer" so you copy about 5 characters
behind. (This is not easy but it's how the higher speeds are done.)
* Practice both with headphones and "open-air" copy as the code test
may be in either format. (If you only practice one, you may fumble
on the other.)
* Most of all, don't give up! Recognize when you reach plateaus
and keep trying until you break through them.

** What is the standard for measuring Morse code speed?
The word PARIS was chosen as the standard length for CW code speed.
Each dit counts for one count, each dash counts for three counts,
intra-character spacing is one count, inter-character spacing is three
counts and inter-word spacing is seven counts, so the word PARIS is
exactly 50 counts:

```
PPPPPPPPPPPPP AAAAA RRRRRRRRR IIIII SSSSSSSSS
. - - . . - . - . . . . . .
1 1 3 1 3 1 1 3 1 1 3 3 1 1 3 1 1 3 1 1 1 3 1 1 1 1 1 7 = 50
^ ^ ^
^Intra-character ^Inter-character Inter-word^
```

So 5 words-per-minute = 250 counts-per-minute / 50 counts-per-word or one count every 240 milliseconds. 13 words-per-minute is one count every ~92.3 milliseconds. This method of sending code is sometimes called "Slow Code", because at 5 wpm it sounds VERY SLOW.

The "Farnsworth" method is accomplished by sending the dits and dashes and intra-character spacing at a higher speed, then increasing the inter-character and inter-word spacing to slow the sending speed down to the desired speed. For example, to send at 5 wpm with 13 wpm characters in Farnsworth method, the dits and intra-character spacing would be 92.3 milliseconds, the dash would be 276.9 milliseconds, the inter-character spacing would be 1.443 seconds and inter-word spacing would be 3.367 seconds.

** I'm confused. What do all those abbreviations mean???
AM Amplitude Modulation
AMSAT Amateur Satellite Corporation
AMTOR Amateur Teleprinter Over Radio. A more sophisticated version of RTTY. Also used commercially as SITOR (Simplex Teleprinter Over Radio).
ARRL American Radio Relay League
ATV Amateur Television - a way to see who you're talking to!
CAP Civil Air Patrol is a volunteer organization that searches for downed aircraft and missing kids and uses frequencies just outside of the ham bands and often uses modified Amateur radios
CB Citizen's Band radio, this is NOT part of Amateur Radio and does not require any license to operate
CQ An on-the-air request for a conversation with anyone
"dupes" A dupe sheet is a duplicate check sheet, in matrix format, used to quickly check that you have not had a "duplicate" contact with someone (on a specific band or mode) in a contest
Elmer An amateur radio mentor, or "Master Craftsman" to a new ham. Could refer to anyone, regardless of age or gender.
FCC Federal Communications Commission, the "law enforcers"
FM Frequency Modulation
FieldDay A June activity to practice emergency communications for 24 hours....wives call it 'an exercise in male bonding' :-).
HF High Frequency - 3 MHz to 30 MHz
HT Handy-Talky, a shorthand for "hand held radio"
LF Low Frequency - 30 kHz to 3 MHz
MARS Military Affiliate Radio System, military affiliated Amateurs who provide free communications for overseas GIs and other Federal services. MARS operators are licensed under DoD instead of FCC.
NTS National Traffic System, a way to send radiograms
OF Old Friend, or Old F#$%, used to denote an older ham

OM Old Man, refers to any ham, including female hams
packet computer bulletin boards/electronic mail via Amateur Radio
PRB Private Radio Bureau, administers Amateur and CB services
QSO One of the Q signals used in Morse code to mean "conversation"
QCWA Quarter Century Wireless Association, membership means you've
been a ham for more than 25 years
RTTY Radio Teletype - older form of computer communications on HF
SAREX In Amateur Radio talk, Shuttle Amateur Radio EXperiment, a
chance to talk to astronauts in space. In CAP talk, Search
and Rescue EXercise, practicing for the real thing.
SK Silent Key, a nice polite way to say a ham has passed on "to
that great antenna farm in the sky"
SSB Single Side Band - need less band width than AM or FM
SSTV Slow Scan TeleVision - REALLY slow, low data rate, typically
used on the lower frequency bands
UHF Ultra High Frequency - 300 MHz and above
ULF Ultra Low Frequency - 30 Hz to 300 Hz
VHF Very High Frequency - 30 MHz to 300 MHz
VLF Very Low Frequency - 300 Hz to 30 kHz, audio frequencies
WARC World Administrative Radio Conference, a summit meeting that
occurs every few years, required by international treaty to
determine how the spectrum get sliced up to all vying
communications services (last one was in 1992)
XYL eX-Young Lady, or wife
YL Young Lady, non-ham girlfriend or female ham
2m Shorthand for "2 meters" (144-147.995 MHz), which is a
reference to the wavelength of a common Amateur frequency
band used for local communications

** What do all those "tones" mean?
Sub-Audible Tone: A low tone that you're not supposed to be able to
hear. It's used as a "PL Tone." PL is "Private Line", a trademark
of Motorola for their implementation of CTCSS (Continuous Tone Coded
Squelch System). Basically, the transmitter sends the signal with
the Sub-Audible tone and the receiver only opens when it hears signals
with that tone. Signals without the proper tone are ignored. This
is useful for "closed" repeaters, or for repeaters on the same
frequency that have overlapping geographic areas.
Tone encode refers to the feature of providing the tone on transmit.
Tone decode refers to the feature of responding to the tone on receive.
Tone squelch refers to all of the above. DTMF refers to Dual Tone
Multi-Frequency, or "Touch Tone" which is a trademark of AT&T. DTSS
probably means Dual Tone Squelch System and refers to the feature of
providing a predefined sequence of Touch Tone digits to open the
repeater for transmit. DTSS is an alternate method from CTCSS, which
provides a way to use a "closed" repeater even if your radio doesn't
do Sub-Audible Tones.

** Where can I learn more about Amateur Radio if I live outside the US?
Write to the ARRL and ask. They can usually tell you how to get a
license in your country.

If you know of any location where this information is available electronically, whether by an e-mail server, anonymous FTP, or a contact person, please mail it to us so we can include it here. Send it to hamradio-faq@amdahl.com.

** How can I get a "reciprocal license" if I am a licensed ham from another ** country or if I am a FCC licensed ham who wants to operate in another ** country (on vacation)?

Editor's note (11/92): the regulations affecting this question are being changed. Contact your local Volunteer Examiner (VE) and ask about a VE 60-day pass. More details will be included in future revisions of the FAQ.

This paragraph is soon to be obsolete:

You need to submit a FCC Form 610-A to the FCC, PO Box 1020, Gettysburg, PA 17326. They will then send you a reciprocal permit for alien amateur licensee (FCC Form 610-AL). You must be a citizen of a country with which the United States has arrangements to grant reciprocal operating permits to visiting alien Amateur operators.

This information is still current:

For FCC licensed hams operating abroad, the following guidelines apply:
* A reciprocal license is required in all foreign countries (that have a reciprocal operating agreement with the US), except Canada, where the FCC license is automatically valid.
* Send a SASE to ARRL Regulatory Information Branch, telling them which country you are going to visit and they will send you the info and an application form. Foreign hams can likewise request information from their national Amateur radio society.
* Submit your application with a certified copy of your Amateur license (ie, notarized copy), and fee if applicable (use a bank draft of a bank that does business in that country) to the appropriate licensing administration of the foreign country. Processing may take 30 to 90 days.
* If less than one month, you could try sending the application and pick up the permit upon arrival in that country.
* Most countries will not allow you to bring communications equipment into their country without a license or permit. If you applied, but haven't received the permit yet, show the copy and your FCC license to the customs officer, however, the equipment may still be held at customs until your departure.
* Be sure to use only those frequencies covered by your FCC license which are also used in the foreign country, unless otherwise authorized.

** My apartment or housing complex does not allow outdoor antennas, now what do I do?
First of all, don't despair. Many hams have similar problems. Many books offer advice for the growing group of hams that cannot put up

antennas. Some options are:
* Install an "invisible" antenna made of magnet wire.
* Disguise an antenna as a flag pole.
* Install an antenna in the attic.
* ASK the apartment manager. You may find they will let you put up something as long as it "is invisible" or "doesn't disturb your neighbors" or "doesn't attract lightning".
* Operate primarily from your car.
* If the restriction is due to local ordinance, you may have relief via PRB-1. Meet with the local government and seek an informal compromise. It is possible to win in court...but it's expensive and time consuming.
* If you are restricted by "covenants" attached to the deed of your home, your options are severely limited. Covenants are considered to be private, voluntary contracts between individuals and are outside of the intended application of PRB-1. In many cases, you can petition the Homeowner's Association for an exception. Sometimes you can win in court on the basis that other violations of the covenants by others without action taken constitutes abandonment of the agreement.
* For further information, contact the General Consel's office of the ARRL, 225 Main St, Newington, CT 06111.

** I got TVI...HELP!!!
Here's some hints on Television interference, but this is not a complete list. There are also books on the subject available from ARRL.
* If cable TV is an underground feed, look for central distribution box. Check for a grounding rod.
* Try installing torroids on the cable TV cable close to the TV, and maybe torroids on the AC cord as well.
* VCRs are notorious for RF leakers, try disconnecting the VCR.
* Check to see if interference is better or worse when cable is disconnected and you use rabbit ears instead. It could be the cable company's problem!
* Calling the cable company may get results, since they are also responsible for RF leakage from their equipment. However, they are very often obstinate. Good luck! Try some or all of these suggestions before calling the cable company:
1. Log the interference, noting geographical location, frequency, and characteristics.
2. Bring it to the cable company's attention in writing, preferably addressed to "Chief Engineer", or "Technical Staff".
3. Don't be accusatory, instead ask for assistance in resolving the problem. Try to work it out with someone technically knowledgeable.
4. Do mention your "licensed radio system", but try not to be too specific about "ham" or "CB" unless requested.
* Try moving the radio antenna further away from the TV sets. Make sure the SWR is LOW.

** Did you know that you can get college credit for being a ham?
It's true! You can receive up to 14 credits in electronics and
engineering thru placement tests for CLEP (College Level Entrance
Placement) exams and DANTES (Defense Activity for Non-Traditional
Educational Support) exams if you have an Advanced or Extra class
Amateur license. For more information, ask your campus education
office or (for DANTES) your military education office.

** On what frequencies do JPL and GSFC retransmit the shuttle audio?
Station VHF 10m 15m 20m 40m 80m Video
WA3NAN 147.45 28.650 21.395 14.295 7.185 3.860
W6VIO 224.04 21.280 14.282 7.165
K6MF 145.585 7.165 3.840
W5RRR 146.64 28.495 21.350 14.280 7.227 3.850
W6FXN 145.46
KA9SZX 146.88 426.25
K4GCC 146.94
WA4VME 145.17

All frequencies are in MHz. Use FM on VHF, USB on 10-20m, LSB on
40-80m.
WA3NAN - NASA Goddard Space Flight Center (GSFC), Greenbelt, MD
W6VIO - NASA Jet Propulsion Laboratory (JPL), Pasadena, CA
K6MF - NASA Ames Research Center (ARC), Moffett Field, CA
W5RRR - NASA Johnson Space Center, Houston, TX
W6FXN - Los Angeles, CA
KA9SZX - Champaign-Urbana, IL
K4GCC - Titusville, FL (near or at Kennedy Space Center)
WA4VME - Melbourne, FL (near or at Kennedy Space Center)

** Can I take my HT on an airplane and operate it if I get the permission
of the captain?

Technically, maybe. But don't count on it. In general, you can't use
a radio or scanner on an airline (or charter) *unless* the airline
allows it and the pilot-in-command (PIC) determines that it will not
interfere with the instruments and radios on that specific aircraft.
Very few US airlines allow passengers to use radios so be ready to
disconnect the antenna when you ask. (Don't even ask to transmit.)
For reference (in the US) the pertinent portion of the Federal Aviation
Regulations (FARs) is Part 91, paragraph 91.21.

Due to airport security, you may have a little difficulty carrying the
HT (or any electronic equipment) onto the airplane. Generally, you
can appease the security guards, simply by showing that the unit is
operational and doesn't have a bomb inside. For a radio, just turning
it on and opening the squelch satisfies them. Expect more difficulty
during periods of increased security.

On a private airplane, it is legal to operate an amateur radio if you
have the permission of the PIC. It is still possible for the radio to
interfere with the plane's navigation or communication equipment, so
be sure to ask first. Always obey the requests of the PIC. He knows

his airplane and radios better than you do.

** How do I modify my current Amateur license?
To modify your license (change of address, change of station location, change of name, renewal, or even change of callsign), submit an FCC Form 610 to the FCC. Forms are available from the FCC or ARRL or a local VE session or ham radio store. Do NOT use a photocopy. Check off the appropriate boxes, fill in the new/changed information, SIGN THE FORM, and attach a copy of your current license (or a brief letter of explanation for its absence, ie, "my dog ate it"). NOTE: If you check the box to change your callsign, YOU WILL GET A NEW CALLSIGN, even if all you wanted was to supply a new address; if you want to keep your callsign, DON'T CHECK THAT BOX. Send the form to FCC, POB 1020, Gettysburg, PA 17326. Turnaround time (for CURRENT licensees only) is about 2-4 weeks.

ANY ham can apply for a new callsign (this is different from the past where you can only get a new callsign if you move or upgrade). You can't specify WHICH ONE you want, a new one comes from the same pool as new licensees for that class of license. The callsign is based on your mailing address. For overseas military and civilians, be sure to specify a station location that is within FCC jurisdiction.

New licenses are for 10-year terms. If you apply for renewal before its expiration date, the expired license is valid for 60 days after expiration to allow for the new license to arrive. You have up to 2 years after expiration (5 years for an old 5-year license) to renew before re-examination is required (but you can't operate with an expired license). You will lose your current callsign after 1 year after expiration if you don't renew.

** I'm confused about XXX, should I ask the FCC?
Whatever "XXX" is in this case, the overwhelming ARRL and net opinion is a resounding "NO!", at least not as a first step. Amateurs are generally very law-abiding people and have historically written the FCC asking for clarification on some operating practice or another. This is a very dangerous practice, for several reasons.

Most amateur radio regulations (contained in Part 97) are generally very loosely-worded, so as not to restrict experimentation and new techniques. But asking the FCC for a clarification will set in motion the process of "clarifying" it for everyone (i.e. new rulemaking.)

Examples of such restrictive rulings include varying topics like when Hams can help non-profit agencies or effectively forcing packet BBS sysops to screen messages before forwarding them. They were the result of well-intentioned questions by Hams that forced the FCC to make a ruling where they previously allowed the amateur radio community to police itself.

Under all circumstances, it is better to first read the rules yourself. Then, if there's a problem, ask your national amateur radio organiza-

tion (such as the ARRL in the US) which can give qualified advice about interpretation of FCC regulations. Organizations like the ARRL also have the influence to ask the FCC informally, without forcing a ruling.

Even if asking the FCC doesn't result in a restrictive ruling, it is generally a good idea to not overburden an under-staffed and under-funded government agency with a lot of correspondence. The Amateur Radio Service has traditionally been a low-workload "hands-off" service, and has enjoyed a wide latitude from the FCC. Please don't ruin this image for your fellow amateurs.

** Is there any information on antique radios?
Antique radio classifieds: ARC, PO Box 802-B6, Carlisle, MA 01741 - old radios, TVs, ham equipment, 40s and 50s radios, telegraph, books, etc.
Hallicrafter Service manuals: Ardco Electronics, PO Box 95, Dept Q, Berwyn, IL 60402
Antique Wireless Association, Bruce Kelley, W2ICE, Route 3, Holcomb, NY 14469 - sponsors the Wireless Museum

** Where can I buy vacuum tubes?
Kirby, 298 West Carmel Drive, Carmel, IN 46032 (1-317-843-2212)
Antique Electronic Supply, Box 1810, Tempe, AZ 85281 (1-602-894-9503)
Fair Radio Sales, Box 1105, Lima OH 45802
Fala Electronics, Box 1376-1 Milwaukee, WI 53201
Southern Radio Supply, 1909 Tulane Ave, New Orleans, LA 70112 (10504-524-2343)

** What do I need to get started in packet radio?
Packet radio is a digital form of communication using radios. There are OTHER digital forms, as well, like CW, RTTY and AMTOR. To use packet radio, you'll need a radio (2 meters and 70 centimeters are most popular), a box that converts radio signals to digital signals that a computer can understand (called a TNC or terminal node controller) and a computer or terminal. For some computers or TNCs you may need special software as well. However, most TNCs and computers get along quite well with just a terminal emulator software package. Most personal computers can be interfaced to use with packet radio. Since there are many digipeaters, generally even an HT will work with packet radio.

Your first source of information on Packet Radio should be the rec.radio.amateur.packet newsgroup. It has its own regularly-posted FAQ that goes into much more depth on the subject than this one can. See also the mailing list and archives info in Part 2.

For more information on packet radio, you might try TAPR (Tucson Amateur Packet Radio), PO Box 12925, Tucson, AZ 85732 (602-749-9479).

** What do I need to get started in satellite communications?
For more information about Amateur Satellite Communications, try AMSAT (Radio Amateur Satellite Corporation), PO Box 27, Washington,

DC 20044 (301-589-6062). They also have an international net on Sundays on 14.282 MHz at 1900Z.

** What is available to get started in ATV, SSTV and WEFAX?
This is a large subject area in itself. Amateur Television (ATV), Slow-scan TV (SSTV), and Weather FAX (WEFAX) all deal with transmitted pictures. (ATV includes moving pictures and audio just like your household TV.)

Equipment is available to interface to most common microcomputers including PC clones, Amigas (which are prominent in most video applications anyway), Atari ST, and others. (At last check, we didn't see Macintosh on the list.) There are also a handful of publications on the subject.

All this information is available via FTP in the /pub/ham-radio directory at ftp.cs.buffalo.edu. (See Part 2 for more information on FTP.) The file called sstv_wefax_info is maintained by John Langner WB2OSZ (johnl@avs.com).

The ARRL e-mail server contains an introduction to SSTV in the file sstv-info. (See Part 2 for more information on the ARRL e-mail server.)

Another resource is the regularly-posted UseNet Elmers Directory. The list contains a volunteer Elmer who can help with ATV, SSTV, and WEFAX questions.

** What are these contests I sometimes hear, and how do I participate?

Dozens of contests are held each year, usually at weekends, and can provide useful operating experience. They typically last for 24 or 48 hrs, and are usually on SSB or CW only (the Russian CQ-Mir contest is on both modes at the same time). You can participate by making one QSO or several thousands. In most contests you send a signal report (traditionally 59 or 599) followed by a number that is different for different contests - the most common one is a serial number (so you send 599 001 for your first QSO, then 599 002 etc). The exchange may, however, be your age (All Asian contests), your CQ or ITU zone (CQWW and IARU contests, respectively), your state (ARRL contests) or something else. Read "Contest Corral" in QST for the rules for all major contests - the more serious contester may wish to subscribe to the National Contest Journal, or join the e-mail contest mailing group (write to Trey, WN4KKN, at garlough@tgv.com). Knowing the rules can prevent embarrassment - you will get a cool reception if you are a W or VE and call a W/VE in the ARRL contests, since they can only work non-W/VE stations. Otherwise, QSOs made in contests are just as valid for DXCC (DX Century Club - more than 100 contacts), WAS (worked all states) and other awards as are 30-minute ragchews. Although not strictly a contest, the annual Field Day provides very useful operating experience under less than optimal conditions and is highly recommended for new operators - check with your local club for their Field Day

plans some weeks before the (late June) event.

493. FAQ's and User Education (was RFD: rec.radio.amateur reorganization)

Newsgroup: rec.radio.amateur.misc

I've pretty much stayed out of this discussion so far as everyone seems to already be doing a pretty good job of slugging it out. Most of the major issues, arguments, and counter-arguments have been presented and fully discussed except for one. It's one of the reasons I've been wishy-washy about the whole reorganization:

In article <paulf.732999697@abercrombie.Stanford.EDU> paulf@abercrombie.Stanford.Edu (Paul Flaherty) writes:

[...]

I think we may be better off spending our time trying to convince posters to improve the quality of their posts, while reducing quantity.

As an example, consider the current no-code flame war. The original post was pure flamebait, and should have been treated as much -- don't take such postings seriously. Instead, we now have several dozen posters pummelling away, all saying about the same thing, while the baiter snickers in the distance. One reply post amounting to "your mother wears army boots" would have sufficed. Or, instead of posting, send large quantities of email instead. Or, direct the followups to .policy.

A short, to the point FAQ on posting to rec.radio.amateur.misc just might help.

[...]

In article <6bo403v3cfXo00@amdahl.uts.amdahl.com> jgt10@uts.amdahl.com (John G. Thompson) writes:

[...]

The major complaints againist option I seem to be about cross posting to/from r.r.a.misc. This seems to be born from the idea that a poster will post to all groups he thinks are apropriate and that when in doubt he'll post to several groups. I'd still like to suggest a weekly reminder posted to all the r.r.a.* groups as a method to re/train the habits of the posters. Heck, if we need to edify people of the reorg. make the posting twice weekly!

[...]

Having been involved in the maintenance of the FAQ's and other periodic information postings for the rec.radio.amateur.* newsgroups for over two years, I can tell you that it's far from a cut-and-dried issue. While I appreciate (and agree in principle with) the above comments, those that advocate "more information, posted more often" should take note of the

following points:

- FAQ's for this newsgroup already exist.

Part 1 of the FAQ already covers newsgroup netiquette, and the "Guide to the Personal Radio Newsgroups" that Jay Maynard and I co-maintain describes the charters of all of the rec.radio.amateur.* newsgroups, in addition to rec.radio.info, rec.radio.swap, and rec.radio.cb.

While it's been my experience that a significant number of the readers of this newsgroup notice, read, and (most importantly) follow the advice offered in these articles, there will still be a clueless minority who either won't read them, or will feel that the guidelines don't apply to them. An increasing number of readers and posters will mean that this minority will always get larger in absolute number, if not percentage.

FAQ's cannot be a panacea. They can be a useful tool, but ultimately there are limits to their influence.

- FAQ's don't grow on trees.

They need dedicated volunteers to write them, and post them to the net. I'd welcome Messrs. Flaherty and Thompson's volunteerism in publishing and maintaining the FAQ's that they describe. The current suite of articles is maintained by a team of people who have endured great amounts of administrivia, flaming, and second-guessing of their work. They've found that it's not as easy as it first seems (although for the right type of dedicated individual, it has its rewards).

Since these FAQ's have found their niche more or less, I am worried what the increased number of newsgroups will imply with regards to FAQ visibility. Should smaller, individualized, FAQ's be posted to each new newsgroup? Perhaps a pointer in each new newsgroup to the centralized FAQ posted in misc? Who's going to do all this extra work? These are questions that need to be addressed.

- Greater periodicity is not without pitfalls.

I'm sure Mr. Thompson had his tongue firmly planted in his cheek when he advocated posting the netiquette guide 8 times a month to make sure people see it. There is a serious point be made, though, about FAQ visibility. Currently the main FAQ is posted monthly, with a mid-month archive pointer. This walks the razor's edge between getting lost in the noise and incurring the wrath of experienced users who don't want to see it repeatedly (and news administrators who don't want to pay for the extra volume). More bandwidth was wasted on needless public flaming on this issue than was needed (and I've participated it in more often than I care to admit).

Although, if I was really cynical, I might take the articles that I maintain, post them daily for a month, then benefit from the increased publicity that the flaming generates (i.e. the "2-Live Crew Principle"). Fortunately, I'm not that far gone (although I am a little dismayed that

not too many people noticed my April Fool's joke).

Any other opinions on the matter?

73, Paul W. Schleck, KD3FU

So soon after the flameup when someone asked for any mods for one of these radios ?

The basenote dated the first of April ?

But all that happened were friendly and helpful replies.

Methinks a joke fizzled, and that the world is becoming a better place !

Cheers

496. A New DSP

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-07 12:28:34 UTC
From: jwa@tellabs.com
Message-ID: <1993Apr7.122834.27997@tellab5.tellabs.com>
Source record: 283683

In case your interested in DSP's Here is an article that
I worte, that appeared in the January 92 issue of QEX

A NEW DSP FOR PACKET

In the early 70's synthesized radios became available to the Amateur market. However, the technology wasn't new. The Military used synthesized radios since the early 60's. The computer and micro-processor became popular in the mid 70's and that got us into the packet age in the 80's. But we all know that electronic computers where around for about 25 years. In the 90's, it appears that the hottest item is the DSP. Again the technology has been around for about twenty years and it's finally making it's way into the Ham Radio market. As with any new technology the reason for it's availablity is cost reduction due to large scale integration.

Manufactures of Ham gear are including DSP's in their products and there is a little skepticism about the price! Is it really worth the three or four hundred more dollars just to clean up a few harmonics in my signal? How can it improve packet reception on HF? Will I have sell my old gear ? After being involved in a DSP development project I beleive that the DSP can make a significant improvement in HF packet and RTTY reception and it's well worth the investment.

For the about the past 7 years the DSP has been reduced to a single chip about the size of the microprocessor in your computer. In fact, the DSP is nothing more than a microprocessor. A very special processor that can handle mathematical computations at lightening speeds. The DSP that I'm involved with runs on a 40 mHz clock and Texas Instruments now has a version that runs at 50 mHz.

Like any new technology the price is always high at first. But when newer chips are developed, the old ones drop in price. That's true with the TexasInstruments TMS320C25 DSP. When it was first introduced about two years ago, it cost about $125.00. Now you can get them for about $25.00 in single quantities. That's why we choose the TI DSP for our project.

THE DSP25 BLOCK DIAGRAM/ DESCRIPTION

The DSP25 is an inexpensive Digital Signal Processor that plugs into the 8 bit expansion port of an IBM PC or IBM compatible computer. It provides audio connections to a receiver or transceiver for operating digital modes in the HF or VHF bands. It also has an 8 bit TTL input/output port for interfacing to a Packet or all mode

TNC. There is also a 16 bit I/O port on a 32 pin header connector
to interface to a baby board which can contain a dual parallel DAC
for connecting an X/Y tuning scope or other ancillary devices.

The DSP can replace the TNC's analog filters, fsk demodulator or tone
encoder. It can also be used as a digital audio filter for CW mode,
a digital signal analyzer and a digital oscilloscope within the audio
range. FSK signals are processed and converted to a TTL level to the
8 bit I/O port or they can be converted to an RS232 level and trans-
ferred to the audio out port. The FSK signal can also be regenerated
(eliminating 100% of the noise) and interfaced to a TNC's audio input
(A to A connection).

The audio to audio connection simplifies the "hook up" and still provides
the advantage of improved error performance. The DSP25 consist of four
basic circuits, the PC Host interface, a Texas Instruments 40 mHz TMS320C25
Digital Signal Processor chip, 8k words of RAM, and a Texas Instruments
TLC32044C Analog Interface chip. It's constructed on an IBM PC/XT
compatible 10" expansion PC board and the analog/digital connections
are accessible on the rear bracket/panel.

THE HOST INTERFACE

The PC Host interface decodes the PC address, passes data from the 8 bit
PC bus via the buffers and latches to the 16 bit DSP bus. It provides
handshaking between the PC and DSP, and by placing the DSP chip in hold
mode, DMA (direct memory access) from the 8k RAM to the PC I/O port is
possible. There is also a sequential address decoder which allows the
PC to access the ram in two 4k word pages for loading binary files from
a floppy or hard drive and for providing direct memory access for large
data transfers.

THE ANALOG INTERFACE

The Analog Interface chip converts the audio or linear signal to digital
data. It transmits the data on a receive serial communications port to
the DSP chip. The DSP processes the data and returns it to the A/I chip
via the transmit serial port. The A/I can be programmed for pass through
mode and there are 3 gain steps available. The DSP pcb has filter chokes
to reduce EMI interference to the receiver and a quad op-amp is used to
boost the signal in either direction on the analog port.

SOFTWARE

The software for the DSP is still under development but we do have two
working modems that are di-no-mite! The PKT modems are for packet and
test results so far are very promising. We decided to work on the 300
baud modem first because the problems on H.F is causing the packeteers
the most trouble. We have ran test using 45 baud RTTY and the PKT modem
was very promising but the filters need to be retuned for the lower baud
rate.

Here's a brief description

PKT SERIES MODEMS

The PKT series modem is computer software that is designed to operate on the PC compatible DSP25 Digital Signal Processor for 300 baud Packet Radio and ASCII modes. They where computer simulated and tested to obtain maximum noise rejection and the best possible error rate performance for Amateur and SWL applications.

Except for the analog interface and IO port, the block diagram on the next page is hypothetical and does not reflect an actual working circuit or electronic diagram. The modem filters and functional blocks are embedded in the software. Several functions can be changed or modified using the "Control Panel" software that is provided with each modem.

The Analog Input

The audio signal from an H.F. receiver/transceiver enters the analog interface chip and is converted to data. The data is sent to the DS Processor and it performs the mathematical functions (indicated by the blocks).

Pre-filtering

The first function is a sixth order Chebyshev bandpass filter. The filter reduces noise and improves the performance of the A.G.C. block. The data is then processed by the limiter which sets a maximum numeric limit. The data is then passed to the second sixth order filter which further reduces noise and pre-filters the signal for the frequency detection blocks.

FSK Decoding (The Frequency Detection Block)

Two fourth order Bowtie tone filters are separately tuned at the mark and space frequencies. The filters separate the energy in FSK signal. The signal or data is then rectified by generating positive numbers from the mark filter and negative numbers from space filter.

Post filtering

The numbers are further processed using a lowpass filter. It removes the high frequency components in the serial bit stream and further improves the signal to noise performance. Other mathematical routines include a threshold detector and hysteresis. The data is then passed as a serial bit stream to the I/O port or other functions. The modem also includes a carrier detect, an FSK oscillator and control logic which allows the user to setup various parameters using the Control Panel software.

OTHER PKTA/PKTB MODEM FUNCTIONS

Modem Parameters

The Carrier detect routine keys the FSK oscillator on and off as well as providing an output via the I/O port on DIN1. It also (bydefault)

sets the AI chip in a loopback mode when no signal is detected. This allows the user to monitor the channel via an external speaker/ amplifier during quiet channel conditions. The channel can also be monitored via the first and second prefilter which reduces the audio bandwidth and noise. The first and second perfilters can be used as a CW filter.

Audio to Audio connection

A parameter can be set which allows the user select the FSK oscillator only. This function provides an interface from the DSP to an external TNC's audio input and it regenerates the received signal with noise a free FSK generator. The TNC decodes the FSK using the improved signal to noise performance of the DSP. During a quite channel (no packets) the FSK oscillator will be disabled, then the TNC can key the transmitter using the normal connection to the XMT key line for packet operation. If the monitor option was enabled and the regenerator disabled because no carrier was detected, the received channel can be monitored via the DSP using the full breakin capabilities of the software. The user can also use the audio oscillator to provide audio FSK to a transmitter,s "mike" input. Because of the XMTR's low input level, a resistor divider network is needed to drop the audio level to the XMT

Audio to Digital connection

The Audio input to the DSP connects to the receiver's speaker or aux audio output. It can handle levels as high as 1 volts p to p however, overdriving of the DSP can damage it or cause poor error performance. The typical level should be about .3 to .7 volts RMS.

The TNC's TTL level serial data input is connected to the DSP's DOUT0 output. The FSK is demodulated by the DSP and the serial bit stream is sent to DOUT0. The TNC decodes packets or RTTY using the improved signal to noise performance of the DSP. DOUT1 is the inverted serial output.

The TNC's TTL level serial data output is connected to the DSP's I/O port DIN0. During transmit, the data from the TNC is switched to the DSP's FSK oscillator. The DSP,s oscillator is connected to the transmitter's audio input using an attenuater network. This allows the user to implement the DSP's continuous phase, frequency shift oscillator .

DOUT 2 is a TTL level Carrier detect. It can be connected to a TNC to be used as an external carrier detect.

DOUT3 is a XMT key line and can be connected to some TNC's for keying the transmitter. This output is a TTL level output and requires a special circuit for transmitter keying.

TEST RESULTS

I conducted a test using two PK232's and an Icom R71 common receiver on 20 meters (the TNC's where in monitor mode). One PK232 was connected to the DSP card Via the external modem input on the rear apron. A modem formerly called P3020 (now PKTB) was loaded into the DSP from an IBM PC. The other "barefoot" TNC was connected to a Compaq Deskpro and both computers copied the text to a capture buffer. The time/date on both TNC's where set within a few seconds. A Radio Shack counter module #277-302 was connected to the carrier detect L.E.D. circuit. The threshold was adjusted for average strength packets.

HERE ARE MY RESULTS

Test #1

Both TNC's didn't copy very many packets. The band condition at that time was poor.

Test #2;

The band condition improved and 182 packets where counted. The PK232 copied 47 and the DSP/PK232 copied 116.

Test #3

Only 3 packets where copied on the barefoot PK232, on the other hand, the DSP copied 82 out of 202.

Test #4

There where 78 packets out of 487 for the PK232 and the DSP/PK232 copied 162.

As you can see the DSP, depending on the band conditions, did a much better job. The DSP makes a better FSK decoder because the filters where designed and simulated for a specific application (packet radio). If the circuit in the PK232 was simulated on a DSP the two units probably would have performed the same.

COPYING CW

The upgraded version of the PKT modems have a feature that allows the user to monitor the receivers audio through the FSK decoder's pre-filters. I used this setup to copy CW and weak cariers on 20 meters. I was able to pull out signals that where almost in-audible (about equal with the noise level). The second prefilter was selected. The first prefilter responce was about equal to a 4 pole BP chebychev. When I tuned to a stronger signal, I tuned across the filters bandpass (about 400 hz) in noticed as I reach the lower or upper limit of the passband, the signal dissapeared as if the filter had infinate stopband response.

Conclusion

The DSP is a newcomer in the HF digital world. More software and better modems that can handle the hostile HF environment are needed.

Because the DSP is versitle modems can be developed, simulated
and easly loaded. It will allow developers to try other modulation
schemes that can greatly enhance digital communications on H.F.

Now, if an amateur is heading homewards, and, using the autopatch, phones home only to be told to buy bread on the way.

1) The QSO is not the actual bread buying transaction, nor is it an advertisment for some specific baker, nor is it a recruitment ploy on behalf of any of the major religions which have a thing about bread, or any of the similarly fixated political ideologies.

2) Had the QSO not taken place, the need for bread would still exist, so the amateur would be dispatched back to perform the errand. The QSO has not influenced one crumb of bread sales. The QSO has affected fuel consumption, but those objecting to this side effect can be threatened with having their names fed to the most militant conservationists available.

No problem. I ran a 7MHz and a 3.5MHz 4-square vertical
array for years amid 70 foot oak, hickory and hemlock trees.
I took very precise measurements of a 7MHz vertical among
the trees and another one exactly like it away from the
trees, each with 120 1/4 w.l. radials. No difference
in their self-impedances noted.

As a guess, I would say that effects from trees would occur
as the frequency was raised and that perhaps by the time
one came to 28MHz there would be some. However, a ground
mounted vertical at 28MHz isn't such a good idea even
in the clear, if more optimum results are the objective.

Source record: 283660

Without certain copy of the callsign, there is no route to obtain a
QSL card without external help of one kind or another.

Perhaps the original poster's purpose was to find out if he really
did hear something from xxxx, where he thought there was no activity?
curiosity is a common enough human trait.
If the purpose was to get another country for an award, then relying
on the usenet to get the callsign seems not to be in the spirit of the
game, nevermind the rules. Asking in such a public place would be
terribly naive if he was hunting an award, someone's bound to have
tipped off the DXCC by now.

Personally, I have a sliding scale of merit for QSO's.

"I found it out of the blue" comes top

" I got through a pile-up I came across"

"I'd heard/read there might be an expedition...."

"The cluster said xxxxx was on 14.... right NOW!"

"yyyyyy called on 2m/landline to tell me... "

" The pileup policeman told me it was my turn.."

" xxxx made sure we got the details right"

.

.

" He never replied to me, but I sent a QSL anyway, got one back"

ETC.

Some folk do things honourably, but sufficient do not, so awards are
somewhat tarnished nowadays. This is unfair to the honourable people.

Perhaps DXCC is becoming more of a test of postal prowess?

Just where on the scale above is the threshold one accepts is a
matter of personal opinion.

Cheers
David GM4ZNX

The pines will play havoc with the antenna pattern when they are wet,
but when they are dry they won't absorb too much of the signal. Of course
putting the antenna farm on open land is ideal, but we rarely find
ideal conditions. You'll find seasonal changes in performance with the
vegetation present that may affect antenna tuning. Still, I'd say go
for it.

The following TH-78A Modification File information was gleaned from a posting on Packet by Rich Garcia N2CZF...Packet via N2CZF@WT3V.NJ.USA.

OWNER ASSUMES ALL RESPONSIBILITY FOR MODIFYING OR USING THESE MODIFICATIONS!

The following mods will provide for Crossband Repeat and Extended Receive/ Transmit on the TH-78A HT.

Diode #4 - Enables Crossband Repeat
Diode #5 - Enables Extended Receive and "out-of-band" TX.

Remove all screws and open radio as explained in the Kenwood manual for installing the memory expansion module.
On the back cover you will find the memory expansion module socket and a copper shield just to the left of the memory expansion module.
Under this shield their will be a row of SMC diodes which are unmarked in a vertical configuration to the lower right portion covered by the shield.

"The original posting from Rich instructed you to remove the copper shield at its four corners...on my 78 there was a cut-out that exposed the Diodes therefore removing the shield was not necessary..."

Remove the shield at its four corners with a solder sucker and SMALL iron!

Carefully count down from the 1st Diode in the row to the fourth one and remove it to enable the Crossband Repeat. "HINT" I found if you "BRIEFLY" touch the iron to the right side lead while gently pulling up on the SMC diode it should completely come off without needing to apply heat to the other side and further risk board damage. I used a pair of right angle surgical tweezers for this task.

Follow the same procedure as above with the fifth diode to enable the Extended Receive and Transmit modification.

NOW...put the thing back together...Reset the CPU (yes you will loose all of your programmed memories)...reset by pressing Function for more than one second and then "0"..the above modifications are now complete.

Now that you have removed Diodes D4 & D5 the following transmit and receive frequencies should be available to you:

RECEIVE TRANSMIT
VHF BAND

50-135.995 (AM (NA)
136-179.995 136-179-995
300-399 (AM & FM) (NA)

SUB-UHF

400-511.99 400-511.99

UHF BAND

400-511.99 400-511.99
800-949.9875 (NA)

SUB-VHF

50-179.995 (FM) 136-179.995

To utilize these "mods".....

Crossband Repeat....Press F for 1 second, then 0....the decimal point on both vhf/uhf should start "blinking".....you can now crossband repeat... repeat same sequence to disable. CAUTION....she'll get quite warm/hot!

Wideband RX VHF side: You must be in the VFO for this feature to work.... Press F for 1 second, then BAND...on the VHF side this yields 300-400 RX, pressing F for 1 second and BAND AGAIN will yield 50-179RX.

Wideband RX UHF side: Again you must be in the VFO for this feature to work..Press F for 1 second, then BAND...on the UHF side this yields 400-512 RX, pressing F for 1 second and BAND AGAIN will yield 800-950 RX.

300-Mhz Band AM/FM switching....hold down the VFO key and switch the POWER on to switch between AM and FM..

You can also "Channelize" the display..ie...CH1, CH2 instead of the actual frequency showing...hold down the 3 key...turn power on....

For those of you who use the Paging feature....Answerback feature (during paging reception)...Hold down the MHZ key and switch POWER ON to turn this function on and off.

Game function....Hold down the M and PTT key...switch POWER ON.

There are other versions of these mods in circulation...BE CAREFULL...I've seen mods out there that looked right but further reading showed that the mods mentioned were for the TH-78"E"....not sure that those mods would work properly with the 78A...

Anyway...I hope this information will help...I've tried to be a brief as possible but still get the point across...AGAIN...THIS IS INFORMATION THAT I HAVE PULLED FROM A PACKET MESSAGE...I'VE CHANGED SOME OF THE WORDING AND ADDED MY OWN THOUGHTS TO HELP CLEAR UP SOME OF THE CONFUSION THAT MIGHT OCCUR..THESE MODS HAVE WORKED FOR ME BUT "NO GUARANTEES THAT THEY WILL WORK FOR YOU"...THEY SHOULD BUT "PROCEED AT YOUR OWN RISK...OWNER ASSUMES ALL RESPONSIBILITY FOR MODIFYING OR USING THESE MODIFICATIONS.....GOOD LUCK!! ROGER/N5IFH....

504. Postal Expertise

> Perhaps DXCC is becoming more of a test of postal prowess?

Which gets me going on a related issue. Its getting to where getting the QSL is as much, if not more of a challenge, than making the qso. It even bears a resemblence in that it requires expertise encompassing raw information (routes) and processes (best way from here to there and back), a time commitment and money.

I think Bell Labs did some research years ago essentially verifying
this. I think Moxon's book "Antennas for All Locations" (?) covers
that. As I recall effects at 10mhz would be negligible. If you're interested
in details let me know and I'll check my bookshelf.

Netlanders,

At one time, the elements from T.S. Kelso appeared on the news feed
a couple times a month. I have not seems them lately was wondering
if they still appear here.

They also used to be archived on nachos.ssesco.com, but I can't seem
to get that machine to answer.

Does anyone know where I can get this info on the Internet or any
general info on what has happened to the distribution?

Thanks...

Another name for copper-clad wire is copper-weld. I recently purchased a
250' roll of 18 gauge copper-weld from AES in Milwaukee for $14.95 to use
for making ladder line. I found that local hardware stores and electrical
supply places never heard of the stuff.

In rec.radio.amateur.misc, ikluft@uts.amdahl.com (Ian Kluft) writes:
>emd@ham.almanac.bc.ca writes:
>>Given our experience with rec.radio.policy, which by any criteria
>>has been a dismal failure at moving policy discussions off of
>>r.r.a.m., however, why are those of you proposing the split
>>confident that more newsgroups will work?
>
>We've already been through this point several times. Yes,
>rec.radio.amateur.policy has not accomplished its goal because it was intended
>to be a dumping ground for an unwanted topic.

I think this somewhat overstates the case. From the perspective of
improving the signal-to-noise ratio of r.r.a.misc, yes, r.r.a.policy
has been a failure. But applying the same test to r.r.a.policy that
is being applied to the proposed groups gives a somewhat better result.
There are at present several ongoing policy discussions in r.r.a.policy.
(76 articles in the past week, by my count). Yes, there's some flamage,
too, but I wouldn't characterize the level of flamage as being
damagingly high. The level of traffic--including the level of
flamage--varies with time, of course, but over all r.r.a.policy seems
to be picking up steam and becoming more of a useful group. It still
isn't removing all--or nearly all--of the "policy" discussion from
r.r.a.misc, which is why I don't consider it an unqualified success,
but I think it is not an overall failure. In light of the fact that
the name r.r.a.policy isn't particularly enlightening (I know: so think
of a better one, fella!), this to me bodes well for the proposed split.

>>All that will occur is that EVERYBODY will cross-post to a
>>r.r.a.m. as well as the specific group.
>
>Cross-posting is too much work for most users. They won't do it in the
>numbers you fear. Some will, but it will most likely be insignificant
>compared to the regular traffic in the groups.

I agree. Why should people xpost between all of the r.r.a.* groups
any more than they already xpost between the r.r.a.* and other
groups? Some level of unreasonable crossposting will always be with
us. That is not, in itself, a reason to deny ourselves the benefits
of a well-chosen heirarchy of news groups.

511. Transverter o/p - FT736, IC202S, TS790E ??

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-07 16:59:28 UTC
From: esrlb@csv.warwick.ac.uk
Message-ID: <1pv19gINN2ue@clover.csv.warwick.ac.uk>
Source record: 283671

Has anybody any experience of using any of FT736, IC202S or TS790E as part of a transverter set-up, i.e. LO on tx and tunable IF on rx?

I've been told that the 736 has no transverter jack on the back, and suspect that the 790 may be the same. The IC202S certainly has no such luxuries.

Are standard mods available for such work, as I've not been able to find anything at the ftp sites?

Thanks for any help in advance,

73, Simon G0GWA.

512. Readership Report for the Radio-Related Newsgroups

This is the full set of data from the USENET readership report for Mar 93.
Explanations of the figures are in a companion posting.

```
+-- Estimated total number of people who read the group, worldwide.
| +-- Actual number of readers in sampled population
| | +-- Propagation: how many sites receive this group at all
| | | +-- Recent traffic (messages per month)
| | | | +-- Recent traffic (kilobytes per month)
| | | | | +-- Crossposting percentage
| | | | | | +-- Cost ratio: $US/month/rdr
| | | | | | | +-- Share: % of newsrders
| | | | | | | | who read this group.
V V V V V V V V
1 280000 6721 91% 12 170.2 100% 0.00 12.9% news.announce.newusers

296 38000 914 76% 1771 3921.0 8% 0.14 1.7% rec.radio.amateur.misc
310 37000 897 77% 705 1730.9 12% 0.06 1.7% rec.radio.shortwave
454 31000 737 74% 414 455.2 10% 0.02 1.4% rec.radio.swap
638 25000 598 75% 275 566.7 4% 0.03 1.1% rec.radio.amateur.packet
762 22000 524 57% 530 835.1 2% 0.04 1.0% alt.radio.scanner
871 19000 460 75% 136 272.0 1% 0.02 0.9% rec.radio.noncomm
932 18000 427 74% 168 281.9 5% 0.02 0.8% rec.radio.amateur.policy
972 17000 404 72% 122 268.2 4% 0.02 0.8% rec.radio.cb
986 17000 399 52% 182 858.3 8% 0.05 0.8% rec.radio.info
1145 14000 329 63% 187 484.3 1% 0.04 0.6% rec.radio.broadcasting
1282 12000 280 49% 141 224.2 33% 0.02 0.5% alt.radio.pirate
1755 4900 118 34% 7 8.5 0% 0.00 0.2% rec.ham-radio.packet
```

Several positive trends continue this month. The recently-created newsgroup rec.radio.info is rapidly gaining in popularity, and being carried at more sites. It has since overtaken rec.radio.broadcasting, and is now tied with rec.radio.cb. In addition, the long-since-defunct rec.ham-radio and rec.ham-radio.packet newsgroups are slowly going away. This month's Arbitron report did not track a single reader in its sample that was still subscribed to rec.ham-radio.

On the negative side, rec.radio.amateur.misc continues to have an extremely high cost on a per-user/per-month basis. Bad news for convincing news administrators who pay for news to carry it.

>You are calling us idiots you know, and if not directed at *us*, what
>about people like my wife (completely computer illiterate) who understands
>these concepts and can hit the '?' key when she doesn't ...

Whoa there big fella! :-) Nobody called you or your wife or any of the
rest of us idiots. His statement is fundamentally correct. I work with
educated talented people, many of whom don't have a clue as to how our
newsreader works. It's just not high enough on their priority list.

>Now to the point, one can `subscribe' to all the groups, ALL news readers
>are capable of reading articles that are cross posted, in their primary
>group only. You do NOT see articles twice (unless a user has broken
>netiquite and multi-posted) and you can see everything! I do not see
>that you are hurt by this progress!

Whoa there once again! My newreader (a Unix based one no less) makes
seperate copies of xposted articles. I get to see *all* xposted
articles multiple times. I do not have the option of changing readers
for a variety of internal reasons. *Many* others are in similar
situations. The xposting problem is *real* for many of us. Please at
the very least do not minimize real problems as you argue for or against
splitting.

>solder and seperate flux) Do I need to use Acid flux instead of Rosin Flux?

Frank, if you clean the brass rod with fine grit sand paper and not touch the area afterwards, the solder should stick. Depending on the brand of SO-239 you are using on how easy it is to get the solder to stick. Radio Shacks connectors are a real pain to get solder to stick to, especially the outside holes for the ground plane elements. What I have found that does work most of the time is to grind some of the chrome off the connector around the holes. I do this with a 1/4" drill bit. Clean the inside of the center pin of the connector to get rid of the chrome in there too! Heat the rods, radiator and ground plane elements, about 1/4" to 1/2" from the connector and apply solder that has the flux in it, plus a little more rosin flux, to the rod at the point where the connection will be made. The center should be easy and the grounds will be a little harder, but IT WILL WORK.

>has the D14 installed by the factory. Has anyone tried this mod,
>i.e., cut D14? Does it really work??

Yes! But you will be bored about it. Cross band repeat works well only
if the transceiver has range (use a good mobile rig with cross-band and
it can actually be useful at an event). We set up a pair of 24's with cross
band repeat to make a single band repeater even, still a waste of time.

We have had troubles with people linking UHF and VHF repeaters together
using the cross-band repeat function of their handhelds. So far, it has
shown to be an annoyance to the community.

Enjoy, Ciao, 73 de VE6MGS/Mark -sk-

Notice that I wasn't really calling for a reduction of expectations - I'm in favor of a split in rec.radio.amateur.*, even though it may result in me seeing some messages more than once - by now I'm used to hitting the 'n' key when I recognize that I've seen a message before. And for that matter, sometimes the second or third reading provokes a response that the first reading didn't.

There's a difference between saying that only readers that conform to the de-facto standard will be taken into consideration and saying that there exist no readers(or other news-reading mechanisms) that do not conform to that standard(which is essentially what the post I originally responded to said). Waffle is not the only non-conforming mechanism. Sites that gateway USENET into Fidonet(or make newsgroups available via Fidonet Technology) will turn cross-posted messages into multiple copies. The same is true for newsgroup-to-mailing-list gateways(which, I note, _is_ a consideration in the rec.radio.amateur.* reorganization). I'm sure there are other examples that I don't know about.

For single-user Waffle sites, there may be a solution, as someone recently posted a program that will go through a Waffle news spool and delete all but one copy of cross-posted messages. For multi-user sites, that isn't appropriate, as users will probably not be subscribing to all newsgroupss. I may give it a try and see if it works out on my under-powered system(a 10-Mhz V20 XT clone).

Or rather, 13 to 7 or 8 in real numbers. I think you'll be amazed at the number of folks waiting in the wings to vote a resounding NO (of course, I could be amazed by the number of folks just waiting to vote YES too..) I am singularly unmoved by the "it worked in rec.autos, rec.aviation etc arguments - is there a guerilla force that moves from group to group dreaming up splits ? Where to next ?

FWIW - I also think .info was a total waste of time, Paul Schleck (apologies if I mis-spelt your name) explained the rationale to me ("kill file hack"). I still can't hack my kill file to make it work, and I suspect there are many more like me...

20 or 21 replies seems to me like a poor response for a request for a QSL route, let alone a reorg RFD.

One of the neat things about amateur radio is the fact that you
retain your ananimity (sorry, the dict. is at work) for the most part:

o The KKK member doesn't know that ham he's working is Black.

o The anti-semite doesn't know the feller at the other end of
the keyboard is Jewish.

o The chauvinist knows Chris is an engineer, but doesn't know
she's a YL.

o And you just worked WX1ABC, and didn't know he's gay...

And EVERYTHING is fine...

Until one of these groups wants to form a club. Then the "can we
get away with persecuting them without reprocushions" kicks in.

Well, when one of these groups DEMANDS I join, then they're messing
with my rights. If they want to all get together, and talk in another
language instead of English, that's fine. If they want to be "Jewish
people only" great - they'll have more in common and probably have a
better, stronger radio club. "Brothers on bugs" - fine business, too.
"Gay-netters" - no problem.

The whole homo-phobic thing is being propagated by people who have
no idea of what "being gay" is all about. It is alot like the
Twilight Zone episode, where the aliens play with the electric company,
and 50's hysteria takes over (they almost kill a ham radio operator).

You don't get "gay" by talking with one. Or being near one. Or even
hugging one. If you're REALLY straight you don't have a problem.

What you really need to do is go to a gaybar on a busy night. I
pestered my best friend to take me to one when I visited him.
We ran into all sorts of NICE people. And once you tell someone
"I'm not interested" they don't try to force you to their
way of thinking/feeling. Women should have such a deal when they
tell some guy "I'm not interested" and he continues to harass them.

Remember: being gay isn't contagious.

gay people don't reproduce, making more gays.

gay people come from straight parents.

they're out of the closet, and they're not going back in.

BUT one of your kids could come down with it.

Madison Ave. has done surveys, and has found that the average
gay person:

o earns above-average wages

o lives above-average

o spends above-average

o owns their own home

Madison Ave. sees a vast untapped group that's affluent, and
likes to spend. As soon as they can figure out how to advertise
to them, without alienating their current "bigotted buyers",
the ads will be pouring out.

Hi,
I am investigating to see if ka9q with attach (1)PI or (2)SCC AX25 can be used to drive a synchronous modems (up to 14.4k baud) network in a phone multidrop configuration, let the master drop be the router/gateway to Internet.

AnyOne has any info about what sync modems or tnc's to use with csma/cd to do the job on a multi-drop phone line??? Or we have to write a token polling link layer software to ensure no collision???

Thanks for any INFO!!!

When you take out the undecided or unclear (unclear == one-liners not
expressing any opinion) comments, it's 2-to-1 in favor of the split.
If you're counting the undecided posts, I had to include them only so no
one would say I was omitting anything. They obviously cannot be counted as
for or against.

And by extensions its users don't count? C'mon. What's required here
is not an indictment of other's software, systems, or limitations, but a
reasoned discussion of what users of these groups desire and require.
Check the postings on this topic. It may not be ideal, and it may not
be what you'd like for it to be, but the fact is that many of us have
no choice but to use systems that do not deal gracefully with
xposting.

What matters are the opinions of the users, not how good or bad the
software choices available to them are.

527. Repeater coverage on MacKenzie Trail in British Columbia, Canada?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-07 21:58:00 UTC
From: chowe@bbn.com
Message-ID: <ls6jj8INNbj0@news.bbn.com>
Source record: 283684

Hi,

I have a friend here who is going to go hiking in a part of
British Columbia and is wondering what to carry with regard to
emergency communications equipment. He is willing to study for and
get a Technician license so he can carry a 2m handi, but that just
leads to the question of whether there will be any repeater coverage
should he run into trouble.

The area he'll be hiking is the Alexander MacKenzie Trail between
Quesnel and Bella Coola. This will take him through the Tweesmuit
Provincial Park, but much of the hiking will be outside, and there are
8000+ foot mountains around. I was wondering if any B.C. hams might
be familiar with this area and had any suggestions regarding possible
repeater (or any type of radio) coverage of the area for emergency
use. My guess is that there is little or none, but I'm not
familiar with the area, and I would be happy to be surprised.

Thanks in advance for any information you might provide,
Carl Howe

>If anyone has investigated this scanner, please contact me. I'll be
>attempting to get a service manual and software from Uniden if I can.
>

I had the scanner, the programming cable, the Uniden software and
the Uniden Service manual. You can get the software, for $20 as
I recall, from one of those scanner specialty companies which advertise
in CQ and/or QST. Someone on the net here probably has a copy.

The software allows you to maintain a crude database on your PC
and UP/Download it to the MR-8100. With a special code word
(ECPA1988), the software will allow you to unput cellular frequencies.
The other major feature is that you can program alphanumeric
titles for the displayed frequencies.

I got rid of my 8100 because it does not do band scanning. It will
only scan what it has in memory - period. There is no way , for
example, to scan from 140-150 Mhz and stop on busy channels.

On the plus side, it seemed to have a fairly sensitive and quiet
receiver, and very strong audio. The service manual was nearly
useless with respect to the programming port. The best that you
will get is some schematics which show the pin layout of the CPU,
and some possible clues for hackers to investigate.

I tried to analyze the data protocol between the radio and the
PC, and found that there is some encryption taking place. I also
tried disassembling the PC software but it's written in compiled
BASIC and is very hard to make any sense of. I was not, for
example, able to find the secret code word in the software.

Anyway, have fun and 73,

-fred

Yes, I'm just noting that he's saying "get your software fixed" to someone who probably can't do anything about it. Rather than antagonize the user, encourage them to send input to the author. That approach will probably yield better results.

I'm sure we'll hear more complaints from Waffle users. They need to realize that they don't have a firm foundation for their arguments. It really is time to push the author(s) to fix it to handle cross-posted articles like other news systems. It isn't in any RFC but the precedent has been strongly set by Unix's dominance of the Net - cross-posted articles should be stored only once in the spool, read only once by the user, and transmitted only once to neighbor sites.

One thing that may make more or less of a difference here is whether waffle sources are available or if it's only distributed in binary form. I personally don't need an answer to that - I have UTS (SVR4) on mainframes at work and Linux on my 386 box at home.

> an ad."
>

Well I would be surprised, if there really is a possible discrimination lawsuit, if the ARRL's lawyer(s) would permit the staff to be at all vocal on this issue, particularly in a widely dissemminated forum such as the Internet. The possibility of the slip-of-a-finger causing much grief later is too real. I have definitely noticed a lack of postings from ARRL staffers in this thread.

[conjecture mode on]

If a lawsuit were indeed threatened, I would also be surprised if the ARRL would accept an ad from Lambda. This is not because they are discriminating against sexual orientation, but rather they are simply exercising their right to run an advertising section in the way they see fit. I wouldn't give someone who was suing me any privileges if I didn't have to, in fact I would make life as difficult as possible for them!

I have an IC-P2AT myself. Just came in the mail this past Monday. I'm VERY pleased with it. I didn't know until I had it that it could do 5 khz steps just like the Kenwood TH-28A.

I ordered the P2AT with no options, but when I experimented with receiving the local cable tv company's frequency of 167.19 MHz with 100.00 CTCSS I was able to hear them. Hmmm. Somehow it got in there. Maybe someone bought it, took it back, and the store forgot to remove the CTCSS chip.

I too would like to know of any legit. mods for receiving other frequencies besides the stock 138-174 MHz. Aircraft 118-122 MHz would be nice.

To person who replies to this and original msg. please send to public Usenet group rec.radio.amateur.misc or e-mail to me:
jim@sys6626.bison.mb.ca

>
>Can the PK-232 have both radio ports active at once, and is there
>also a software USART even for VHF operation?

The PK-232 can't have both ports active at once because it only has
one modem. Port switching is done with a mechanical switch of the
in/out signals. It uses the 8530 USART for true hardware operations.
It'll work with moderately high speed modems as is. A firmware change
would be required for really fast modems and AEA won't release the
necessary data for that. That's another reason to stick with the
fully documented TNC2 design.

>Are standard mods available for such work, as I've not been able to find
>anything at the ftp sites?

With the 736 or 790 just turn the wick down and use a power attenuator.
With the 202 just use an attenuator. You can go into the 202 and bypass
the final if battery drain is an issue, but the external attenuator
is so simple that it's the better course. This is for satellite work
where you crossband. If you're using the transverter as part of a
terrestrial setup, you'll need to arrange a TR switch for the attenuator.
With the Microwave Modules transverters, the IF input and output are
separate anyway, so a TR switch is already required. With the SSB Electronics
transverters there's a single IF port for in and out. You need to make
the TR switch simply bypass the attenuator on receive.

> MFJ loop and the AEA isoloop. Any reccomendations ?

My wife ordered the MFJ for me for Christmas -- I haven't heard anything
since. Apparently it was still vaporware then, don't know now but I've
yet to hear of anyone who actually got one.

Hey.. can anyone tell me more info about this scanner? like freq.
coverage,channels etc... and where i could get one and how much? or if
anyone is selling one? thanks!
email or post on the net!

When you arrive in Anchorage, jump on the 146.94 machine,
call KL7IKX or KL7ITI. Both these gentlemen are "leaders"
in the VHF community in Alaska and should be able to tell you
what the current frequencies for Denali are.

If my feeble mind remembers right, you should be able to work
the 147.30 near Anchorage or the 145.25 on Mt Sue from there.

Cross-posted to: rec.radio.amateur.misc,rec.radio.info

I've been asked to put on Internet the Condo Communications newsletter. This has previously been circulated on packet and in a modified form on Hap Holly's R.A.I.N. (Radio Amateur Information Network). Enjoy!--N0OQS

==========

Part 1

Welcome to the first edition of Condo Communications, a newsletter devoted to those amateurs who, for various reasons, must configure their stations to operate from restrictive areas such as condos, apartments, townhouses, neighborhoods with outdoor antenna restrictions, ships/boats, mobile homes, or wherever they fry their burgers and call QTH.

The objective of this newletter is to encourage us to investigate means of employing all of the modes available to us for as many different purposes as possible. For examples, how can we use:

ATV
SSB/CW
FM
Spread Spectrum
Digital modes

on

HF thru microwave

for

Traffic handling
Emergency communications
Ragchewing
DXing
Technical exchange

with

QRO
QRP

on

Batteries
Portable generators
AC Mains

and

Attic
Invisible
Portable/Temporary antennas

while causing as little RFI as possible?

Part 2

This part of Condo Communications will be devoted to station descriptions that you submit. I'll get the ball rolling with a description of my QTH.

I live in a wooden, 2-story townhouse topped with a modest attic. The usable space in the attic is about 25 x 25 feet and is floored with plywood. On top of

the roof is a small wooden "cubicle" about 2.5 feet tall by 4 feet by 2 feet in which the air conditioner is housed.

The hf rig consists of a (somewhat modified) Ramsey kit 20-meter transmitter (at

about 1/2 watt output), its companion 20-meter DC receiver, an MFJ tuner, a home-brewed artificial ground, and two antennas: a 1/2 wave 20-meter loop around

the bedroom ceiling and an Isotron 20-meter "bird cage" poked away in the aforementioned air conditioner cubicle on the roof. An ancient GPR-90 receiver comes in handy for picking up WEFAX satellite photos relayed by Point Reyes and for just checking out the DC receiver under marginal conditions. Occasionally, I drag out the old re-conditioned DX-20, but 30 watts out is too easy (and too much TVI!).

The VHF rig is mostly used for packet: an Alinco DJ-F1 HT, an old XT clone, a home-built Bell 202 modem used with Poor Man's Packet, and a J-pole suspended from the rafters in the attic.

And what have I been able to do with such modest equipment? Quite a lot!

Part 3

Operate from a townhouse, half a watt, with indoor antennas? Impossible, you say. Nay, sir. A gas! I've made plenty of QSOs throughout the country, coast to coast, and well into Canada and Mexico with this little arrangement. Every contact is DX as far as I'm concerned. Anyhow, the tx and rx, along with a rolled up dipole, a battery, and a few other odds and ends pack up neatly into two bicycle bags for the summertime bike ride to the local reservoir.

And QRP really cuts down on the RFI. I wouldn't mind running the DX-20 a bit more, but even with low-pass filters it wipes out channel 2 and does a bit of damage to channel 6 to TVs in my building and the one next door. I wonder if a good electrical ground would help? That's quite a ways off in this unit, and hooking up to the bathroom copper pipe made no difference.

With VHF packet I can connect to several nearby gateways for HF fun, local and occasionally DX, and have even hooked up with the Fuji satellite courtesy of N0NBH's pacsat gate. I even contacted MIR once on a very early morning pass, with just 5 watts to the J-pole. And I can pass and deliver NTS traffic via packet.

The HT, of course, can be chunked into the car for ARES work or for working with

the other local weather spotters in the spring.

Now, let's hear about your setups. How did you get around antenna restrictions?

RFI? What do you use your rigs for?

Part 4

Technical correspondence. Submit any technical notes or tips that might be relevant for condo communications. Examples are antenna construction for tight spaces, RFI problems (and solutions, if you have them), experiments with different modes that failed (or worked), and so on. What about some less common

uses for your gear? Have you experimented with scanning schematics into GIF, TIF, or some other graphic format and pushing them around the local VHF/UHF packet LANS? How about swapping program code/data? Do you think you could become a packet gateway even though you operate from a broom closet in a garden-

level apartment downtown? How about receiving GOES weather satellite images through a layer of wet shingles? How would you operate satellite from a QTH like yours? And how big did the coils get in that super-short dipole you've been experimenting with in the attic? Can you really convert the metal flue in that useless decorative fireplace into a 40-meter vertical?

Nothing particularly complex can go here as we aren't going to get away with trying to circulate via HF links any digitized graphic images or R95-converted binary code. But, if you can draw a simple schematic with keyboard characters, like -/\/\- or -||-, then try it and send it in. Of course, you can always leave an address so readers can submit SASE's for schematic photocopies, block diagrams, photographs, detailed descriptions, software code, etc.

Part 5

Bibliography time. Here are a few articles that might prove interesting reading

for condo communicators. I found these in magazines around the shack and will pass on more when possible. Send me bibliographic citations from articles you've read or have found in database searches. If you've read them, pass along

comments or critiques as well.

Arland, Rich K7YHA
QRP
Worldradio
Sept. 1992
p. 56. Rich has an article for people who have limited space, work low power, AND want to work the satellites. Receive on 10 meters, transmit on either 15 or 2 meters. Mode A and K charts included.

Balsamello, Joseph W9KJS
Indoor 10-160M Pole-Lamp Antenna
Worldradio
May 1992
p. 68. A pole lamp with one tapped 90-turn, 2.5" diameter, 9"long air

core coil (#16 wire) and another identical coil (untapped) was tuned (with a tuner) for operations on all bands. Operated from a 5th floor steel-reinforced condo with good results on all bands. Read this one.

Frazier, Dean NH6XK
Baby Loopy: A Half-Wave, Inductively-Loaded Loop.
73 Amateur Radio Today
Oct. 1992
p. 34. A loop antenna, made to fit small spaces with inductive coils. Provides 3-6 db gain in direction of feed point.

Galgan, Ig WA2VIA
A Clothesline Dipole
QST
Sept. 1991
p. 32. Clip your dipole to one of those reel-in clotheslines and you're in business.

Krieger, Pete WA8KZH
Basic Steps Toward Eliminating Telephone RFI
QST
May 1991
p. 22. If you run more than a few watts with an indoor antenna, chances are good you're going to get into the telephones. This short article discusses troubleshooting, grounding, and filters.

Lau, Zack KH6CP/1
Build a Portable Groundplane Antenna
QST
July 1991
p. 33. A PL-259 plug and some #12 wire results in a quickie 2-meter FLAT

groundplane that you can hang in the window on one of those suction cup hooks.

Sloman, Jeffrey N1EWO
The AEA IsoLoop (TM) 10-30: A Big Antenna in a Small Package
73 Amateur Radio Today
Oct 1992
p. 16. Thorough review of the IsoLoop antenna.

Thompson, Nigel KG7SG
A Plumber's Delight Dipole for 2 Meters
QST
Aug 1992
p. 43. A vertical dipole for 2 meters. Could be mounted in a tight attic space or strapped to a chimney. VHF antennas like this are a natural for "covert" operations.

Well, let me know if you've found this newsletter interesting. Send me stuff! It'll go into the next issue which will be released whenever there's enough stuff to go into it. There just has to be a lot of hams out there who, like myself, have failed to achieve the American Dream of a large yard for Rover and

the tower, with understanding neighbors who don't mind when you key the kilowatt

amp, imploding their TV sets and warming their bath water a couple of degrees.

Inspirational note: There's jillions of Japanese hams living like sardines
packed in a tin. And we hear them. How do they do it?

73 de Art
N0OQS @ W0GVT.#NECO.CO.USA

I've been asked to put on Internet the Condo Communications newsletter. This
has previously been circulated on packet and in a modified form on Hap Holly's
R.A.I.N. (Radio Amateur Information Network). Enjoy!--N0OQS
==========
Part 1

Welcome to the second exciting, thrill-packed issue of Condo Communications, a
newsletter devoted to those amateurs who, for various reasons, must configure
their stations to operate from restrictive areas such as condos, apartments,
townhouses, neighborhoods with outdoor antenna restrictions, ships/boats, mobile
homes, or wherever they fry their burgers and call QTH.

TABLE OF CONTENTS

Station Descriptions..... Parts 2,3,4
WB5OAU, AE0Q, AJ5F, N4TCH

Technical Correspondence..... Parts 5,6
N3LSY

Bibliography..... Parts 7,8,9
AE0Q, N0OQS

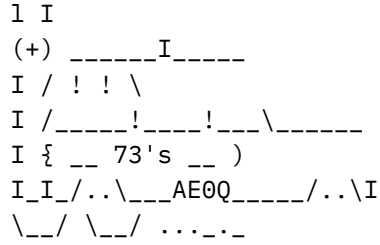
Part 2

STATION DESCRIPTIONS

Seems just about everyone has lived in an apartment at one time or another.
John, WB5OAU reports:

I operated several years out of a studio apartment, with indoor
antennas (Worked all states in one year!) ... it is possible! Keep
up the good work...73/john WB5OAU @ WB2ARS.NM.USA.NA

Of course, you might just operate as much as possible away from the home QTH,
as Glenn, AE0Q, shows us:



Part 3

And then some of us live in Faraday cages, as Dave, AJ5F, and XYL, N4TCH, report.

Our version of the "American Dream" was a condo on Miami Beach. We got a great deal on an 11th floor penthouse with a fabulous ocean view that 10 million northerners and Canadians would kill for. Problem: How do 2 licensed hams continue their hobby from said QTH? The attic is a concrete slab 6 inches thick and the condo association said "No antennas on the roof" (after the work the hams here did during Hurricane Andrew, I may get them to change their minds). Sooooooooo.....antenna is a truck mirror-mount base bolted to the railing on our back porch balcony with a 7 foot tall house plant behind it. The house plant is a perfect disguise. There's a 2m/70cm mobile antenna screwed into the base. I use this for packet, and ragchew on 440. To work HF, since there is only one feedline, and I don't wanna press my luck by running another, we unscrew the 2m/70cm antenna and put in a 20 meter mobile whip. I run a TS-520 with full output (SWR is 1.8:1) with no RFI/TVI (guess the TV cable system here is well built).

The one thing that worries me is grounding. Currently I have a piece of copper bare wire running about to feed to a steel window frame, hoping there might be some ground through the rebar system of the building's structure. Haven't had a problem yet, but who knows? 73 de Dave AJ5F @ W7LUS.#HWDFL.FL.USA.NA

Part 4

Good question, Dave. For an RF ground, you might try an artificial ground (see the bibliography for a reference). Those of us clustered into townhomes, condos, and the like have a tougher time trying to find a good electrical ground. You could try the frame on the electrical socket, but the ground for it may be pretty far away and actually radiate a signal if it's a multiple of a wavelength. How far away is the copper pipe in your bathroom? So, by making a good electrical ground, you may actually worsen your RFI problem. But for those of you fortunate enough to be near to Mama Earth, see the next section: Technical Correspondence.

Now, let's hear from the rest of you. Does anyone operate QRP from a seemingly impossible situation? (After all, I've heard guys who refuse to upgrade to get HF privileges...they live in apartments, so what's the use?). How about QRO. Anyone successfully running maximum legal power from a condo or townhouse? How about running lots of power operating off of batteries or generators, like from a boat or RV? And is it even possible to operate the fancy satellites (like 8J1JBS) from a condo? Or do you keep your satellite rig in the trunk of the car, with antennas strapped to the ski racks, and operate portable only?

Part 5

TECHNICAL CORRESPONDENCE

Did someone mention grounding? N3LSY responds!

Regarding your question as to whether grounding helps with RFI in part 3, I can answer yes. I live in a townhouse and use some rather vintage Hallicrafters gear for my HF work. This is old tube type gear that puts out about a hundred watts or so. I was able to get rid of over 90 percent of my RFI problems, which included TVI, telephone interference, and getting RF burns in the shack by grounding the receiver, transmitter, T-R switch, and Tuner to an eight foot ground rod discreetly sunk into my flower bed, using #10 wire to tie everything together. Indivdual needs may vary, but use good connectors, heavy wire, and keep wires as short as possible for best effect. This will not only make you a better neighbor, but increase the safety and effectiveness of your shack.
N3LSY @ WB3V.MD.USA

Part 6

Makes sense. After all, when you look inside your equipment, stray RF is bypassed to the chassis through capacitors. You have to provide that final leg of the connection to ground. Now, how many of you perched in strange nests have found clever ways to make that electrical connection without radiating harmonics?

Anybody with more RFI hints? Is there a solution to fundamental overload (overpowering all channels)? How can you avoid coupling into the AC mains with your ceiling-mounted beam? Also, let's hear about the really wacky stuff: using your local 440 Mhz 9600 baud LAN to swap huge program or graphic files (is anyone even doing this?), running a packet gateway from a hideaway, bizarre antennas (especially involving gutters, lawn chairs, or metal siding). Did any of you operate clandestine radios for the military? Can you run 10 Ghz equipment from your 30th floor balcony? How about ATV?

Part 7

Welcome to the third exciting, thrill-packed issue of Condo Communicator, a newsletter devoted to those amateurs who, for various reasons, must configure their stations to operate from restrictive areas such as condos, apartments, townhouses, neighborhoods with outdoor antenna restrictions, ships/boats, mobile homes, or wherever they fry their burgers and call QTH.

TABLE OF CONTENTS

Station Descriptions..... N5OP, WD8RIF, KC7IT, KM6CG

Technical Correspondence..... Forthcoming book by KR1S

Bibliography..... N0OQS

There's quite a lot in this issue. I'll let the contributors do the talking (or writing) and keep my comments to a minimum.

STATION DESCRIPTIONS

Kim, N5OP, describes his former condo abode: "I had limited success with a long-as-I-could-make-it vetical dipole that was capacitively loaded on both ends. It worked best on 40, 30, and 20 m but I had RF feedback/grounding troubles on 15 and 10 m. And the RFI problem was difficult to address, since I was doing all of this clandestinely. I camouflaged the antenna with the paint they were using to repaint the condos and it really was hard to see :-) I put it up on a cloudy weekday, about 10 AM, so as to have as few witnesses as possible! I fed it with 450 ohm ladder line through a tuner and worked quite a lot of DX (VE, XE, JA, ZL, VK and a very few Europeans) on whatever power level I could get away with (50 to 100 W). It was fun and I felt that I had pulled it off for the most part, but learned that I couldn't operate as freely as I wished due to RFI and neighbors who objected to the basic idea :-("

Eric, WD8RIF, was sent overseas for Desert Shield/Storm: "...and the gear I took was a Sangean ATS-803A receiver and a 31 meter dipole, for listening. I strung the wire between our tent and the neighbouring one. It worked pretty well, until the wind destroyed the dipole, at which time I made it into a random wire."

Upon returning: "...I found a nice flat, and the landlord there allowed, nay, helped install a 20-foot mast supporting a 2m quad, a 2m ground plane, and a ten meter dipole. The 2m work was mostly packet, and unfortunately, the 10m was mostly useless due to neighbourhood electrical noise. I also had a 31m dipole strung along the ceiling for the ATS-803A, the same rig that went with me to sand-land."

Mike, KC7IT: "FYI: I once worked a guy in Hawaii via OSCAR-13 who was in a restricted condo situation. He kept his antennas and rotator on a free-standing tripod (like the Radio Shack variety) in his garage, and just walked it out onto his driveway whenever he wanted to operate. So long as you can see the part of the sky you need, altitude is no advantage in satellite work."

Howard, KE7QJ: "I live in a single story townhouse with a flat roof - thus I can erect a 30-m length inverted-V, fed with ladder line, and work 10-40 via an MFJ-948 tuner. Rig is an IC-735 at 100 watts. Works great, but, still, 5-9 into some of one of my neighbor's telephones....We're working on it.

"The townhouse covenants say 'no antennas unless completely concealed from public view.' Well, you CAN see mine, if you know exactly where to look, and from where."

Howard goes on to describe this inverted-V antenna: "...the center point of the inverted V is about 7' above the wood roof. There isn't much metal around, except for the heat pump and its ductwork below the antenna and feedline: far more directly underneath the feedline than the antenna itself. TVI is minimal, although my telephone RFI neighbor reported it to me, along with light interference to her stereo. Her TV is connected to CATV, and I think her stereo is, too. This is my neighbor to the north, and it's a 2-story unit. I would guess that her upstairs wiring, in-line broadside to my antenna, is picking up my signals. My neighbor to the south, literally closer to my antenna, report NO interference of any kind. Then again, they don't have fancy electronics."

As far as grounding is concerned, Howard states: "I am in a one-story unit, thus my station is at ground level. The units are 8 years old, so they're fairly new. The ground wire of the electrical outlets connect to the outside cold water pipe. If I ran a heavy wire to my 'cold water pipe' it means I'm actually forming a ground loop! Thus, I have no real ground. But my dipole has its own built in RF ground, so who cares? If I REALLY want to get serious, I'd get a galvanized ground rod and attempt to drive it into this desert soil. But the nearest soil is 14 feet away! That's going to be resonant on some band or another."

Ed, KM6CG: "My QTH is a third floor apartment. I use a Yaesu FT-301D which is a transistorized 80-10 M transceiver. It's supposed to put out 100 watts when equipped with a 20 amp supply. I run it with the gain backed off and I put out about 20 watts. I run 40 M CW exclusively. I don't really have much luck with SSB at these power levels, but that's OK. I got this on the air to build my code speed and don't operate as much, now that I got over the 13 WPM test.

"My antenna is a 40 M 'Coaxial Dipole' as descibed in 73 in 1981 or thereabouts. It runs around the living room and kitchen ceilings. I use a counterpoise, since I don't have a decent ground. I have a low pass filter, and I don't get into OUR TV or any of the neighbors I checked.

"I live in San Jose, CA. I've contacted about 30 states and two Canadian provinces. 40M is good mostly after dark for me. I can hear a band of stations in the midwest (IL, OH, TN, KY) and another in the west (NV, UT, AZ) as well as lots of Los Angeles and Vancouver/Seattle stations. I hear JAs in the middle of the night, but haven't worked one yet. Haven't tried hard though. I have trouble hearing east coast stations like NY and NE, although I've got a few.

"I also run local two-meter packet. My antenna is a 1/4 wave mobile mount with a 1/4 wave wire dangling, to make a 1/2 wave dipole. It's secured to a strip of aluminum (hanging file folder rail) and it sticks out the window about 18 inches. It's secured by sitting something heavy on the other end."

TECHNICAL CORRESPONDENCE

Be on the lookout for a book by Jim Kearman, KR1S, "Low Profile Amateur Radio, How to get on the air from almost anywhere." This book is at the printer right now and should be available soon for $8.00 from the ARRL and dealers. Jim tells me that it will deal with keeping a low profile (like a spy), setting up a home station, setting up in the field, operating mobile, etc., and will cover HF and VHF/UHF. Some simple antennas are included. It will also address RFI. I'll review it as soon as I can get a copy.

I'm sure many of us would like to hear from anyone with some theories about the RFI (or lack of it) reported by this issue's contributors. Some folks have little or no RFI, and others have to really restrict their operations because of it. Why? The type of rig used? The type of TV, stereo, and telephone? Grounding? (Which may actually *cause* RFI?) Type of transmitting antenna or its placement? Your explanations would be most welcome.

SB SAREX@AMSAT $STS-56.004
STS-56 Launch Sightings

The Space Shuttle Discovery lit up a significant portion
of the Eastern Coast of the U.S. early this morning as it lofted
the STS-56 crew into a highly inclined orbit trajectory. The
spectacular night launch occurred on time at 5:28:59.95 UTC or
1:29 am Eastern Daylight Time.

Individuals as far north as New York saw the Space Shuttle roar up
the East Coast on its nightly trajectory. In the Washington D.C. area,
several people saw the Shuttle for approximately 1 minute as it raced
from Southeast to almost due East. When the shuttle main engines cut
off at 8 minutes and 40 seconds into the flight, the Shuttle virtually
disappeared from view. Walt Daniel, N3KVQ discribed it as follows:

"I stayed up and watched the skies to the East from the QTH in
Annapolis (Maryland). The launch took place at 1:29 AM EDT on
8 April 1993. At about 1:36 AM EDT, I saw the Shuttle come into view.
It was brighter than Jupiter and moving pretty quickly (across about
60 degrees of azimuth in one minute). The elevation never got above
10-15 degrees; if the leaves had been on the trees, I would not have
been able to see it. The most interesting aspect of the sighting was
that I could clearly see the brightness fade as the Shuttle main
engines were shut down (I was listening to the WA3NAN rebroadcast).
The shutoff took place at about 1:37 AM and I could not see the
Shuttle after several seconds."

The STS-56 ATLAS-2 mission will carry out atmospheric investigations
of the Earth's Ozone layer during the planned 9 day flight. Also,
on-board as a seconadry payload is the Shuttle Amateur Radio
Experiment (SAREX). SAREX allows school groups and amateur radio
operators to talk to the Shuttle Crew while they are on orbit.

Gil Carman, WA5NOM, from the Johnson Space Center reports that
since the launch was on time and the OMS-2 burn was nominal, the
Keplerian elements (JSC-006) are still good for now. The next
Keplerian element update will occur sometime today. A copy of
element set JSC-006 is provided below.

> {&&, ||} 73476.1142@compuserve.com its loveliness increases; it will
>Katy Mulvey (The new Mrs Mulvey! :-) pass into nothingness..."

Even a small 2-turn, 3' diameter vertical loop made of 1/2" copper or
aluminum tubing will surprise you, but you would be "really" surprised
if you could manage a 2-turn 6' diameter version...with the bottom about
4' off the ground and tuned with a split-stator capacitor. No ground or
radials required but it will be Hi-Q (narrow-band) and remote tuning needed
for conveniently changing frequency. The tuning capacitor (across the ends
of the loop) locates conveniently at the bottom, as well as the 50 ohm coax
feed which taps in directly near the electrical center-tap.
I believe the May issue of "RadioWorld" (due out in a week or two) will
have an extended construction article describing these techniques in detail
for 160-80-40 and 20M bands.

556. Re: Some R5/R7 antenna questions...

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 15:10:21 UTC
From: levine@mc.com
Message-ID: <1q1f8t$6c8@jericho.mc.com>
Source record: 283710

I had used the R5 for 2 years then upgraded to the R7. I have them mounted about 25' above ground strapped to a large chimney. I have over 200 countries on them. They are amazing antennas and I highly reccomend them if space is a problem for you as it was for me. The R7 can be held horizontally but it flexes about 2 feet. Mounting it that way probably won't work as the counterpoise elements wont function as intended. I have seen that thing being whipped by 80mph winds and it held up no problem.

Getting out the C compiler wouldn't be a whole lot of help, as I don't have source, and I currently have better uses for the $90 it would take to get it(not to mention the upgrade I would need to run the C compiler in the first place).

I have had a PK232MBX sitting right on top of my TS850 and have
no problem. I noise getting into the rig when you transmit?
I once cut the white wire (I think white AFSK) and use only
FSK mode now and everything is clean. Some noise was getting into
the rig thru the AFSK wire (PK232-->rig). This was by AEA
suggestion. Anyway, FSK is much better than LSB mode for RTTY/AMTOR.

gary@ke4zv.uucp (Gary Coffman) writes:

>My contention, based on my own observations, is that while there are
>certainly people in amateur radio with narrow focus, leading to varied
>interests in the community, by far the majority of amateurs *individually*
>have many varied interests.

This is true, but when I need packet information, I go to the appropriate
news group. The hope was that net.wisdom would find groups that functioned
as well as *.packet does.

>They have to choose which mail list to join, if indeed multiple mail lists
>are created.

No different than the overload that occurs to a new user presented with
NetNews and going *mad* hitting `U' to unsubscribe to all the groups
he doesn't want. The system is a bit more sluggish for a list server user
than a news user.

>If they join all the lists, then crossposts become a volume issue because
>they are mailed separate copies in each group.
Only a problem due to the current implementation of the lists, sure, the
listserver users are a victim of this, but hopes are that things will
adjust to meet the requirements. I have seen listservers popping up
that DO allow exacting control over what they receive, control over
parent groups etc.

>If Brian doesn't create new mail lists, then those people are
>cut off from areas of discussion.

I would think that the least Brian would do would be to create a listserver
that took the complete glom of articles in the groups and put them on
one listserver address, even with cross-posting (but not multiple posting),
the listserver users would see no difference.

Of course, he could decide to pack his bags too ... (quivering in his space
boots :-)

>If improved signal to noise level is what's wanted, I
>think only moderated groups can make it happen.

Yes and no. You can not imagine the momentum and training required to
convince people to post to moderated groups. A single mistake, and some
flea. Sure, the signal to noise ratio is better, but the signal may
drop off a couple of dB as well ... < plea for people to post informative
articles associated with radio to rec.radio.info deleted as it may cause

people stomache to turn watching me grovel :-) >

>Without someone ruling with an iron
>hand, the wheat and chaff won't land in the right piles.

I could point out that the Ham Community is used to self policing (albeit, much of it is upon deaf ears once those same Hams are all placed on USENET :-). Instead of using moderation, why not use police instead, I am sure there are a couple of people out there that would love the oportunity to be self important :-)

Ciao -- Mark

565. anyone heard of USA BUREAU?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 16:07:24 UTC
From: dale@sequent.com
Message-ID: <1993Apr8.160724.7308@sequent.com>
Source record: 283720

I receieved a post card at our club PO box yestereday requesting that club members be told about the "QSL BUREAU FOR THE USA". This is the first I have heard of this, though there was something a year or so ago (same outfit?) that was to send cards free, funded by enclosing advertising with the cards. I believe this did not work out.

Here is text of card:

QSL BUREAU FOR THE USA

Purpose of the QSL Bureau for the USA is to promote
the exchange of QSL cards in the states. By using the
Bureau, you will not need a call book, send only to one
address, lower mailing cost, No Fee for receiving QSL's.
Just send up to four, 4X9 (#10) SASE's with your call in
UPPER LEFT CORNER.
To send cards, plazce the call of receiving station, on
the address side in large letters. Friends, Clubs, etc.
can combine cards to lower cost. Presort by call Area,
and alphabetically. Enclose $1.00 PER 25 cards.

Send to: USA BUREAU, P.O. Box 309,
Magnolia Springs, AL. 36555

SPREAD THE WORD ON THE AIR "QSL VIA USA BUREAU"
"Operated by KB4TOX"

I tried to type this in as it appeared on card, consider any typos to be mine. It sounds to me that if someone sends me cards via this service I must have envelopes on file, much like my DX QSL service.

Has anyone heard of this? Anyone used it? It seems to me that this would take a dedicated team of volunteers (much like the DX QSL bureau) to really work.

=========
My comment on reorganization of group: Only chance for cutting down the flow of traffic is to moderate the group and have and have moderator reject posts about reorganization, advertising policy of ARRL, CW requirement, legal use of autopatch, and HT's on airplanes. I'm lucky to have a smart newsreader. Unlikely I could read group without it. 73, Dale.

National Semiconductor has a chip for you:LM567. It requires
only a couple of capacitors and resistors. I recall that
the maximum locking range was 14%, but it can be made very
narrow. It has also a low power version: LMC567.
Hope this helps.

I was talking to MFJ this AM .. and asked about the loop.

They said it will ship in about 2 weeks.. they are planning
on having it ad DAyton.

AMATEUR RADIO EXAMINATION OPPORTUNITIES

****

Special Note: The FCC has announced that their license
processing time is at 90 days--from the date they receive the
application. The FCC usually receives the application one
to two weeks after the test session (once the VE Team and the
coordinating VEC have completed their processing).

This can mean that a license may not arrive until more than 100
or more days from the test session has elapsed.

Note: Codeless Technician to Technician w/HF upgraders (who pass a
Morse code test) will not receive a new license from the FCC.
The existing Technician license plus the CSCE conveying the Morse
code test credit is the only documentation issued for use of
the additional HF privileges.

****

The following test session information is provided by the
ARRL/VEC for the upcoming six to eight week period. For
further information, please contact the test session CONTACT
PERSON at the telephone number provided. If necessary, you
may contact the ARRL/VEC at 203-666-1541 x282 for additional
information. Electronic mail may be forwarded to the ARRL/VEC
via USENET at "bjahnke@arrl.org" or via MCI Mail to
MCI ID: 215-5052.

Although the test session information presented here does
not indicate whether walk-ins are accepted or not, most test
sessions do allow walk-ins. We encourage you, however, to
always contact the CONTACT PERSON at the telephone number
provided so that the VE Team is aware that you be attending
the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or
how to locate Amateur Radio clubs, instructors, licensing

classes and/or Novice examiners in your area; please contact
the ARRL Educational Activities Department (EAD) at 203-666-
1541 x219. The EAD can also provide information on
recommended study materials. Electronic mail may be forwarded
to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to
MCI ID: 215-5052.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC
which is coordinating this examination. This single-character
designator denotes the VEC as defined below. An "A" (for example)
indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, or if you do not
find any examinations listed for your area, you may contact
any of the coordinating VECs below.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541

570. Re: STS-56 Mission Sighting & Keps

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 16:39:40 UTC
From: dadams@cray.com
Message-ID: <1993Apr8.113940.20525@hemlock.cray.com>
Source record: 283447

In article AA17582@east.gsfc.nasa.gov, abfhb@stdvax.DNET.NASA.GOV () writes:
|The STS-56 ATLAS-2 mission will carry out atmospheric investigations
|of the Earth's Ozone layer during the planned 9 day flight. Also,
|on-board as a seconadry payload is the Shuttle Amateur Radio
|Experiment (SAREX). SAREX allows school groups and amateur radio
|operators to talk to the Shuttle Crew while they are on orbit.
|

So what must a school group or amateur radio operator do in order to talk
to the shuttle crew?

A few days ago, I posted for some QSL info on a UA9 station.

I now have the information.
Thank you to all who replied.

(Thanks esp. to Thomas Planke (DL5ATP) whom I tried to thank
by e-mail, but the message bounced saying that
"A loop has been detected in the Trace at field for this Message".)

572. MFJ QRP

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 17:09:14 UTC
From: JMG@tntech.EDU
Message-ID: <01GWRNQ3NHG2I2JCSQ@tntech.edu>
Source record: 283722

I have no association with MFJ, other than as a purchaser of their equipment

MFJ QRP 40 Meter rig Impressions:

1. WOW how did they do it
2. Boy is this good
3. Certainly worth the money
4. Would make a great kit

I have owned the 20 meter version of the MFJ QRP rig. I used it at times for operation when hiking, mobile, and as my main rig. I was so happy with the results that I used it as part of an article I wrote up for Feb. QST. Hadn't used it in a while because I am now mainly interested in building my own equipment so I sold it.

Was without an MFJ for about 3 weeks and ended up borrowing a 40 meter version with the Curtis Keyer and the optional filter. My 20 meter version had real good filtering and I never really needed the extra filter.

Well last night a new ham came over with his newly built Oak Hills Research 40 meter QRP DC transceiver to make his first CW contact. We first built a 40 meter resonant dipole for him to take home and then got him on the air.

Well it just so happened I had just got the 40 meter MFJ ready for operation and wanted to compare it to the Yaesu 757 and the Oak Hills. The 40 meter band in my neck of the woods was real noisey and not in real good shape.

I apologized to the new ham and asked if he minded terribly if I turned on the MFJ and checked it out (he had come home from work with me and therefore this was my first chance to do so). I turned on the rig and noticed how noisey the band was and pressed the filter button on the back of the rig.. low and behold.. it really worked. Like I said.. with 20 meters I didn't need this filter.. with 40 sure helps. Well tuned around the band for a minute and heard my favorite letters "CQ". Gave the dude next to me a look saying "may I please". He turned around and said "Go for it".

I sent out my call and was immediately answered. The ham on the other end was a solid 599 with bunches of every type of noise possible and other people right on top. I used the optional filter and the RIT. My signal was a 589. I was told

that my signal was very good and clear which he thought was pretty amazing for 4 watts under the band conditions we were experiencing. I was using a G5RV type antenna (my own mixed up version) with a manual tuner.

I turned on my Yaesu 757 and listened to the same signal. I really enjoy the little Yaesu and use it in contests (including QRP.. it goes down to a milliwatt). I hate to admitt it .. but the MFJ sounded cleaner. I switched on the Yaesu narrow filter and it helped a lot.

MFJ improved the RIT.. now has a center indent (or whatever they are called). The audio still isn't all that loud, even though they put a newer upper case and larger speaker. It is however, loud enough so that I have no trouble using the rig.

One thing I didn't like was the break in. When I finished sending it would take too long to unkey the rig. I had read about the semi/full break in, but didn't want to mess with my original rig. I pulled out the instruction manual this morning before work. It appeared to be a simple little adjustement to change this. I pulled off the cover and there was a clearly marked pot that said QSK right in the front of the board. I started playing with the adjustment. The adjustment worked GREAT, a very solid feel to it. I could adjust it to full QSK or back it off to anything I wanted. I don't really enjoy full QSK on noisey bands. It really bothers me when I am trying to carry on a conversation and hear people that sound like they are on the same frequency. I adjusted the break in to the point at which at my normal sending speed the rig unkeyed immediately after I finished sending... Boy was I impressed.

I used a set of paddles that I made from electronic switches and pieces out of the back of a PC. With the built in Curtis keyer they worked pretty near as well as my Benchers (and they don't fly apart when I accidently hit them.. and can put them in a backpack).

I am now planing on modifying a 1/2 wave helically wound PVC vertical to see if I can use it for both 40 and 20. I could easily fit both the 20 and 40 meter MFJ rigs in the bottom of my backpack and really have a grand time. I also have a piece of fiberglass rod that I plan on experimenting with to make a very light weight portable verticle for either 20 or 40.

I would really be pleased if MFJ would kit this. I love things that work really well that I know that I built.

573. "Postal Prowess" & QSL Requirements For Awards

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 17:37:49 UTC
From: mgustoff@mstcsh.uucp
Message-ID: <1q1ntdlNNijn@chnews.intel.com>

>
> Perhaps DXCC is becoming more of a test of postal prowess?
>
> .....Stuff deleted ....
>
> Cheers
> David GM4ZNX

Indeed it has, so what is wrong with more organizations changing their policies and procedures for acquiring their respective awardsg:

1) Issue awards confirmed via logs and certified by a local club or a couple of hams. I know some skeptics might conclude that this will lead to possible cheating, deception, etc. etc. (But, these are the same people we entrust in the giving of amateur exams, and we're happy with their efforts now where more is at stake if cheating occurred than just a phony award hanging on the wall if cheating occurred during award certification).

This eliminates the required "postal prowess" that GM4ZNX spoke of previously. For those in the hobby that want to chase awards relative to their on-air-operation, but don't have the $$ or desire to collect cards, they would not be burdened with card acquistion when all they an 8x10 certificate showing they "Worked All _________"

2) Reward those that do collect cards with an endorsement sticker that shows they've collected the associated cards to go with the award document, thus allowing those with ample $$$ and "postal prowess" to acquire additional recognition. Many awards these days have endorsement stickers in a range of criteria, from modes, bands, power, etc. etc.. Why not add another one relative to "QSL-Confirmed"?

I encourage those of you not enjoying the card collection facet of our hobby to add up your yearly expenses relative to "postal prowess". Wouldn't you rather spend that money on another rig, antenna, key, or other gadget, and help fund the amateur radio businesses instead of funding the Postal Services around the world?????

kenwood tr7800

I just bought an old Kenwood TR7800 as a backup unit (great deal at a hamfest)

I would think that an old synthesized rig like that should have plenty of modifications possible. Any insight as to what I might do with it?? Any one have any experience with the unit??

575. Re: 40M antenna question

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 17:53:10 UTC
From: tonyz@hpwrce.mayfield.hp.com
Message-ID: <17210007@hpwrce.mayfield.hp.com>
Source record: 283400

My experiences:

If you have an attic, you could construct indoor antennas outlined in several books...they generally stink though. I had a condo with an attic and I shared the upper attic area with a neighbor. I put in a full size 66ft approx 40 meter wavelength dipole and I got out using 100 watts well enough to make stateside contacts...but I also found that I was cause RFI throughout the building and phones due to the proximity of the antenna to stereo's etc....

Never tried one of those small wierd looking box looking jobs in the magazines, nor heard if they work. Another alternative is to use a tuner and run a long wire out to an anchor point using a quarter wavelength.. this is only about 30 ft approx for 40m.

Any way you look at it, you're pretty much screwed. Especially if you are Tech with QRP. Please dont become frustrated though... you know, you are destined to pretty much just answer CQ's instead of calling because even with a good antenna system, a QRP'r usually wont get a callbk when calling unless conditions i.e. QRM, QRN etc are right. You will get more contacts by answering CQ's, believe me. Unless you want to practice sending -.-. --.- a lot... :-)

I currently have a QRP rig set up with a 1/4 wave long wire and tuner up about 30 ft and it works fine.

4 ft up will work, but remember, this is half your station...and running QRP...well, good luck. You would have more fun running more power for now. If you can get a long wire up and out, and dont want neighbors asking what the wire is for, try using magnet wire... the real small stuff..if works great for QRP and will hardly be noticed... I have used this trick.

You might also try finding out if the owner will let you install a vertical. There are multiband verticals available which dont need radials nowadays, and you might even be able to mount it some way to the fence.

Remember, dont become frustrated...QRP is fun! It is just different and more difficult..it requires more patience that running 100W barefoot with a tower and beam...

You will find out when you work that Thunderbay, Australia station with 4 watts!

Good luck, om

Tony.

Just a note about my "upgrade" experience...

I've had my General ticket for about 14 years and decided it
was time to upgrade. Studied about 2 days for the Advanced
portion and successfully passed my test on Jan. 9 . Studied
a little more and passed the Extra test on Feb. 6 along with
the 20 WPM CW portion. Received a note from the ARRL on Feb. 15
stating that my Extra ticket was being held until I returned
a photocopy of my Advanced license.

As of this past Monday I had not received my Advanced upgrade
from the FCC. I called ARRL and was informed that my Advanced
upgrade was summitted to the FCC on Jan. 25 and was issued on
Mar. 3. (~6 weeks after being submitted) So I called the FCC
only to find out that my license was returned to the FCC as
undeliverable mail because they had not sent to the address
that I put on my 610 form but to my former address.(My form
was fille out correctly.) So my upgrade is finally on its
way even though a little late...

Organization: American Radio Relay League - VEC
Distribution: 'na'
Followup-To: rec.radio.amateur.misc
Approved: rec-radio-info@ve6mgs.ampr.ab.ca

AMATEUR RADIO EXAMINATION OPPORTUNITIES

****

Special Note: The FCC has announced that their license
processing time is at 90 days--from the date they receive the
application. The FCC usually receives the application one
to two weeks after the test session (once the VE Team and the
coordinating VEC have completed their processing).

This can mean that a license may not arrive until more than 100
or more days from the test session has elapsed.

Note: Codeless Technician to Technician w/HF upgraders (who pass a
Morse code test) will not receive a new license from the FCC.
The existing Technician license plus the CSCE conveying the Morse
code test credit is the only documentation issued for use of
the additional HF privileges.

****

The following test session information is provided by the
ARRL/VEC for the upcoming six to eight week period. For
further information, please contact the test session CONTACT
PERSON at the telephone number provided. If necessary, you
may contact the ARRL/VEC at 203-666-1541 x282 for additional
information. Electronic mail may be forwarded to the ARRL/VEC
via USENET at "bjahnke@arrl.org" or via MCI Mail to
MCI ID: 215-5052.

Although the test session information presented here does
not indicate whether walk-ins are accepted or not, most test
sessions do allow walk-ins. We encourage you, however, to
always contact the CONTACT PERSON at the telephone number
provided so that the VE Team is aware that you be attending
the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or
how to locate Amateur Radio clubs, instructors, licensing
classes and/or Novice examiners in your area; please contact

the ARRL Educational Activities Department (EAD) at 203-666-
1541 x219. The EAD can also provide information on
recommended study materials. Electronic mail may be forwarded
to the ARRL EAD via USENET at "rwhite@arrl.org" or via MCI Mail to
MCI ID: 215-5052.

584. Want Jammer in Slammer

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 18:32:53 UTC
From: donh@hpcuhe.cup.hp.com
Message-ID: <47540023@hpcuhe.cup.hp.com>
Source record: 283450

A 2 meter jammer has driven me to post! A local repeater here in the bay area has been putting up with a jamming station for quite some time now! We all have been practicing the obvious, ignore him, he will eventually go away. Lately though, this station has interferred with "Emergency" phone patch traffic on numerous occasions. This is where I draw the line!

Since the amateur community is "self policing" these days, what is one to do? Round up all the direction finding equipment in the area and find this individual? Then what? Somewhat like the dog that chases the car, what to do once you've caught it! Should you get your friends together and have a blanket party?

What can a person(s) do in this case. Anyone out there have this same problem? What do you suggest to put an end to this guy?

585. National electrical code and Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 18:40:44 UTC
From: AGRI098@UNLVM.UNL.EDU
Message-ID: <9304081742.AA02127@ucsd.edu>
Source record: 283725

With all the talk about antenna materials and such I thought I would pass along some tidbits from the National Electrical Code. I am not sure how many if any amateurs have their antenna systems inspected bye the local authority having jurisdiction, but if you do this is the part of the code that may be used as the criteria.

Article 810 Radio and Television Equipment

810-11 Material. Antennas and lead-in conductors shall be of hard-drawn copper bronze, aluminum alloy, copper-clad steel, or other high strength, corrosion-resistant material.

810-11 through 810-15 as well as all of Part C of article 810 apply to Amateur transmitting and Receiving station antenna systems

There is a table for size in there as well ... 810-52

I just recieved in the mail a transmitter/receiver matched pair of
old Hallicrafters. Unfortunatly the manuals with them do not have any kind
of date. Does anybody know how old the old HT-46 and SX146 transmitter/receivers are?

Got a lot of restore work ahead of me on the reciever.. time to clean out the
rust. Gonna have it on the air eventually!

Thanks!

587. Remote control of ATV

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 19:00:02 UTC
From: andrem@pyrtech.mis.pyramid.com
Message-ID: <186072@pyramid.pyramid.com>
Source record: 283433
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

I'm posting this to rec.radio.amateur.misc and rec.radio.amateur.policy
as I'm not sure which group would be best. My aplogies if it's
inappropriate for either group.

I have a question regarding the ATV transmissions and whether or not
they can legally be controlled remotely. I'm a member of the
Nor-Cal Shelby club, and am hoping to set up an in-car camera at
one of the upcoming open-track events. I will not be the driver of
the car, and was wondering if it would be legal to have a camera
broadcasting from a car that didn't have a licensed amateur in it as
long as I retained control remotely.

The idea is to give those of us hanging out in the paddock area a
view of what's going on out on the track. This would be just for
fun, and in no way involved in the actual business of running of the
event. I would like to set up a control link so that I could switch
the transmitter on-and-off via 220 or 440. Is there any legal way to
do this? Or do I need to make sure there's a licensed ham both in
the car and at the receiving end?

This thing's gonna be harder to pull off if I have to get some
drivers licensed or make them carry a passenger if we're going
to transmit. Although it could be more fun for a few hams who
would get to go along for the ride...

If anyone could point me to ther relevant portion of the rules
and help provide some interpretation, it would be a great help.

Thanks

I am in need of an external tuner and have found a couple on our local swap net. It is imprtant that it handle over 1000 watts and have a swr/power meter that is large and very visible. I am visually impaired.

The 2 tuners are the

MFJ989C

and

MT3000A by Dentron

I have no knowledge of these and would appreciate any help. Please send e-mail if you can help me out.

Sure, it's legal. Since you are placing a way to turn off the transmitter
via the control link, then you are using "remote control" of the station.

97.109 Station Control (b). When a station is being remotely controlled,
the control operator must be present at the control point. Any station may
be remotely controlled.

Make sure you meet the rules for remote control though:

97.213 Remote Control of a station

An amateur station may be remotely controlled where:

(a) There is a radio or wireline control link between the control point and
the station sufficient for the control operator to perform his/her duties.
If radio, the control link must use an auxiliarly station.

(b) Provisions are incorporated to limit transmission by the station to a
period of no more than 3 minutes in the event of malfunction of the control
link.

(c) A photocopy of the station license and a label with the name, address,
and telephone number of the station licensee and at least one designated
control operator is posted in a conspicuous place at the station location.

Now for auxiliary stations (your control link):
97.201 Auxiliary Station.
(a) Any amateur station licensed to a holder of a [Technican or higher]
operator license may be an auxilliary station. A holder of a [Technician
or higher] operator license may be the control operator of an auxiliary
station, subect to the priveleges of the class of operator license held.

(b) An auxiliary station may transmit only on the 1.25m and shorter
wavelengths, except the 431-433 MHz and 435-438 MHz segments.

(c) Where an auxiliary station causes harmfull interference to another
auxiliary station, the licensees are equally and fully responsible for
resolving the interference unless one station's operation is recommended by
a frequency coordinator and the other station's is not. In that case, the
licensee of the non-coordinated station has primary responsibility to resolve
the interference.

(d) An auxiliary station may be automatically controlled only when it is part of a system that includes a repeater that is also being automatically controlled. [I have never understood the reason for this rule]

(e) An auxiliary station may transmit one-way communications.

593. Re: anyone heard of USA BUREAU?

Dale Mosby (dale@sequent.com) wrote:
: I receieved a post card at our club PO box yestereday requesting that
: club members be told about the "QSL BUREAU FOR THE USA". This is the
: first I have heard of this, ...

Yes, our club got one too. They must have sent them to all clubs listed
in the Callbook.

: Has anyone heard of this? Anyone used it? It seems to me that this
: would take a dedicated team of volunteers (much like the DX QSL bureau)
: to really work.

I was assuming that they pay the postage for sending out cards.
I also assume it is to be a profit-making operation. At 4 cents per
card, they will need to send at least 8 cards in each envelope to make
a profit. That will only work if they get a large enough volume
of users. Perhaps they will also mail advertising to help improve
the profit margin.

One possible problem: They are in some sense competing with the US
Postal Service. There may be some legal problems with Postal Service
regulations. (USPS is a government-mandated monopoly.)

598. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 22:00:30 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.734306430@afit.af.mil>
Source record: 283443

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

> The idea is to give those of us hanging out in the paddock area a
> view of what's going on out on the track. This would be just for
> fun, and in no way involved in the actual business of running of the
> event. I would like to set up a control link so that I could switch
> the transmitter on-and-off via 220 or 440.

Sure, it's legal. Since you are placing a way to turn off the transmitter
via the control link, then you are using "remote control" of the station.

97.109 Station Control (b). When a station is being remotely controlled,
the control operator must be present at the control point. Any station may
be remotely controlled.

Make sure you meet the rules for remote control though:

97.213 Remote Control of a station

An amateur station may be remotely controlled where:

(a) There is a radio or wireline control link between the control point
and
the station sufficient for the control operator to perform his/her duties.
If radio, the control link must use an auxiliarly station.

(b) Provisions are incorporated to limit transmission by the station to a
period of no more than 3 minutes in the event of malfunction of the control
link.

(c) A photocopy of the station license and a label with the name, address,
and telephone number of the station licensee and at least one designated
control operator is posted in a conspicuous place at the station location.

Now for auxiliary stations (your control link):
97.201 Auxiliary Station.
(a) Any amateur station licensed to a holder of a [Technican or higher]
operator license may be an auxilliary station. A holder of a [Technician
or higher] operator license may be the control operator of an auxiliary
station, subect to the priveleges of the class of operator license held.

(b) An auxiliary station may transmit only on the 1.25m and shorter
wavelengths, except the 431-433 MHz and 435-438 MHz segments.

(c) Where an auxiliary station causes harmfull interference to another
auxiliary station, the licensees are equally and fully responsible for
resolving the interference unless one station's operation is recommended by
a frequency coordinator and the other station's is not. In that case, the

licensee of the non-coordinated station has primary responsibility to resolve
the interference.

(d) An auxiliary station may be automatically controlled only when it is part of a system that includes a repeater that is also being automatically controlled. [I have never understood the reason for this rule]

(e) An auxiliary station may transmit one-way communications.

600. QSL help!

Newsgroup: rec.radio.amateur.misc

601. Additional TH-78A Info

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-08 22:26:00 UTC
From: COLERK%snypotvx.BITNET@cunyvm.cuny.edu
Message-ID: <BB685F2BA060A8EA@snypotvx.bitnet>
Source record: 283406

Here is some additional information on the TH-78A..I did not post it with the earlier posting but it may be of some help.

Use the Answerback feature while in the paging mode...you'll have to follow the procedures for Paging as detailed in the manual. I haven't played with the paging function other than to see that it did work!

The following information was pulled off of Packet, sent by PE1ACG. This posting dealt with the European version TH-78E....Answerback function should be the same.....

"If the transmitter pages a receiver, it does not know whether the receiver has received the paging signal or not. When the Answerback function is ON, the receiver returns a code automatically if the paging code matches to indicate that it has received the paging signal. The transmitter can thus confirm that the code it sent has actually been received."

"If the paging code matches and the busy signal goes low, the receiver returns a code. If the paging code does not match, the receiver does not return a code. The Answerback function is related to the bell function: if you turn the bell function ON when the answer-back function is ON, the Answerback functions works; if you turn the bell function OFF, the Answerback function does not work. If the Answerback function is off, only the bell function can be turned ON or OFF. To turn the Answerback function ON and OFF, hold down the MHZ key and switch the POWER ON."

Cloning! The TH-78A can be cloned without cloning cables or special equipment. It is done entirely with RF, and, in fact, can be trans-mitted over the air, and even via repeaters. This may be extremely useful for those users who do not have the patience to program their own radios themselves. This application would also be useful for clubs and user groups. (However, this can take as long as 50 minutes with the ME-1 expansion module installed. It is recommended that a dummy load be used to prevent unwanted QRM.)

How it's done:

1. Both radios must be on the same frequency.

2. Activate both radios by pressing the "0" key while turning the power on. The radios will display CLONE.

3. Now, click the PTT of the "MASTER" radio. The radio will transmit in the economy low power mode. This may take about 4 minutes for fifty channels. When the data has been transferred, both radios will revert

back to the original frequency.

4. Turn both radios off and then on again. They will now operate normally while the slave radio has the same memory contents as the master radio.

THE FOLLOWING INFORMATION WAS ALSO PASSED ON BY RICH - N2CZF - HOWEVER HE STATES THAT HE HAD NOT TRIED THE MODIFICATION...SO...

"Frequency Expansion: You can receive from 340-399.987 Mhz FM by removing chip diode D8 on the CONTROL UNIT. To access this function press the F key for one second, then the LOW key. This toggles between AMATEUR, AIR band (AM) and 360 Mhz. AM and FM modes are selected automatically, depending on frequency."

Extended RX/TX. I think I pretty much covered "what and how" in my posting. If there is something there that you don't quite understand then I'll be glad to try and help you thru that.

A few NOTES worth mentioning:

1. Program scan cannot be performed over bands. It can only be performed within each band.

2. You cannot change the band in MR and CALL modes.

3. The AIR band frequency range is shown below. It is contiguous in the VHF amateur band frequency range.

"Step.....5,10,15,20,12.5, 25 Khz"

"Frequency Range...50.000 - 135.995 Mhz"

4. The initial step is the same as the VHF amateur band step.

5. If the AIR band is received as the UHF subband, FM reception is performed.

6. The step is the same as the VHF band step.

There it is....that's all I have....all of this information came either off of E-Mail or Packet. I performed the "mods" mentioned in my earlier posting (Diodes D4 and D5)....I cannot guarantee that all this information is "the gospel"....check around...ask questions of others using the TH-78A....there are folks out there who will "feed" you "mods" that can "KILL" that sweet little 78A....fortunately I have not ran across them yet...if you've already done the two mods you then you realize that they were "good" ones...the D8 mentioned above I'am not sure of.....soooooo....GOOD LUCK and Enjoy!

73's...Roger/N5IFH

608. Radio Controller for Hams, T-Hunts, DTMF decoding, etc.

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 00:15:29 UTC
From: eahu099@orion.oac.uci.edu
Message-ID: <2BC4C021.7081@news.service.uci.edu>
Source record: 283453

Marty, N6ZAV and I have recently developed a multi-function radio controller kit for amateurs, RaCon 6805. The device is based on the Motorola 6805C8 mirco-controller chip. Along with the CPU, it has a MAX232 serial interface for communicating with PC's, a DTMF decoder for remote controlling, and a couple other IC's. RaCon also has a TNC like interface for interfacing to the microphone and speaker ports of connected transciever, as well as PTT management. We also have 16 binary I/O lines going from the chip to a generic data port for future expansion. Several functions are burned onto the 6805 chip, which are jumper, serial, or DTMF selectable.

Our first goal was to build a fox box controller. This would allow a T-hunter to hide this box, along with a radio somewhere remote (in a tree or a box), and remotely control transmissions with a second radio. RaCon has DTMF programmable callsign, tone sequences, and duty cycles. The callsign of the owner of the kit is burned into the chip. It also has the ability to audio repeat the incoming audio back out to the transmitter, so you can "talk through" the hidden T. It also has security features to prevent unauthorized controlling.

The next function we built was a DTMF decoder, which took incoming audio from the radio (or even a scanner), and sent an ASCII representation out the serial port to a computer. Fun and useful. Then, we made a CW (actually Modulated CW) Keyer which took incoming serial characters, and sent corresponding Morse code characters out the radio port. RaCon handles the PTT line, so you just type. It can be used to send code practice, or engage in a CW QSO with a friend. Next, we made a DTMF Controller, which took DTMF commands to control the state of the 8 binary output lines on the CPU. These lines could be connected to relays to allow remote controlling of external devices.

The final function we have created, so far, is an Auto Pager. Most of my local ham friends have pagers, and we frequently page each other to frequencies, rather than phone numbers. The Auto Pager listens to incoming DTMF commands and then, with a modem connected through a null modem cable on the serial port, dials a pager company and sends a message. For example, if I dial "#2125" on the frequency the Auto Pager is set up to monitor (could even be a repeater), RaCon will dial Marty's pager, and send a message that I want to meet him on "146.895".

What all this leads to is this: Has anyone ever done anything like this before? Can you think of anymore functionallity we can add to our existing functions? Can you think of any more functions we can add that would use the hardware we have on the board (DTMF, serial, etc)? Can you think of any new hardware modules we could add to the data port to inprove functionallity (we have been thinking of a DTMF encoder, a phone interface, and an antenna switch)? Do you have any comments at all?

The kits cost $79, and come with everything but a chassis, and cables. If you are interested in one, want more info, or have feedback, e-mail me. Thanks & 73.

Mike, I have one of the 50s' and I'm very happy with it. It does 100 watts , comes with fm, am, cw, an audio pin in the mike connector for packet use. It has 100 memories and can be modified to work the mars freqs by clipping one side of D5. D5 is located under the bottom cover and stands out like a sore thumb. I sold my TS-430 since I bought the 50. The AT-50 tuner works very well also. It could be stored away and you never have to touch it. I have found prices ranging from 990.00 to 1350.00 for the radio and 279.00 for the tuner. I bought mine at HRO here in San Diego for 990.00 and 279.00. Hope this is enough info for you. 73 de Don N6NLX./

UNSETTLED	***	***	***	***	***	***	***	***	***	***	NONE
QUIET	***	***	***	***	***	***	***	***	***	***	NONE
VERY QUIET	***	***	***	***	***	***	***	***	***	***	NONE
Geomagnetic Field	Fri	Sat	Sun	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Anomaly
Conditions	Given in 8-hour UT intervals										Intensity

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

------------------------------------------------------------
Chart Start Date: Day #038
```

NOTES:
This graph is determined by plotting the greater of either the planetary A-index or the Boulder A-index. Graph lines are labelled according to the severity of the activity which occurred on each day. The left-hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

CUMULATIVE GRAPHICAL CHART OF THE 10.7 CM SOLAR RADIO FLUX

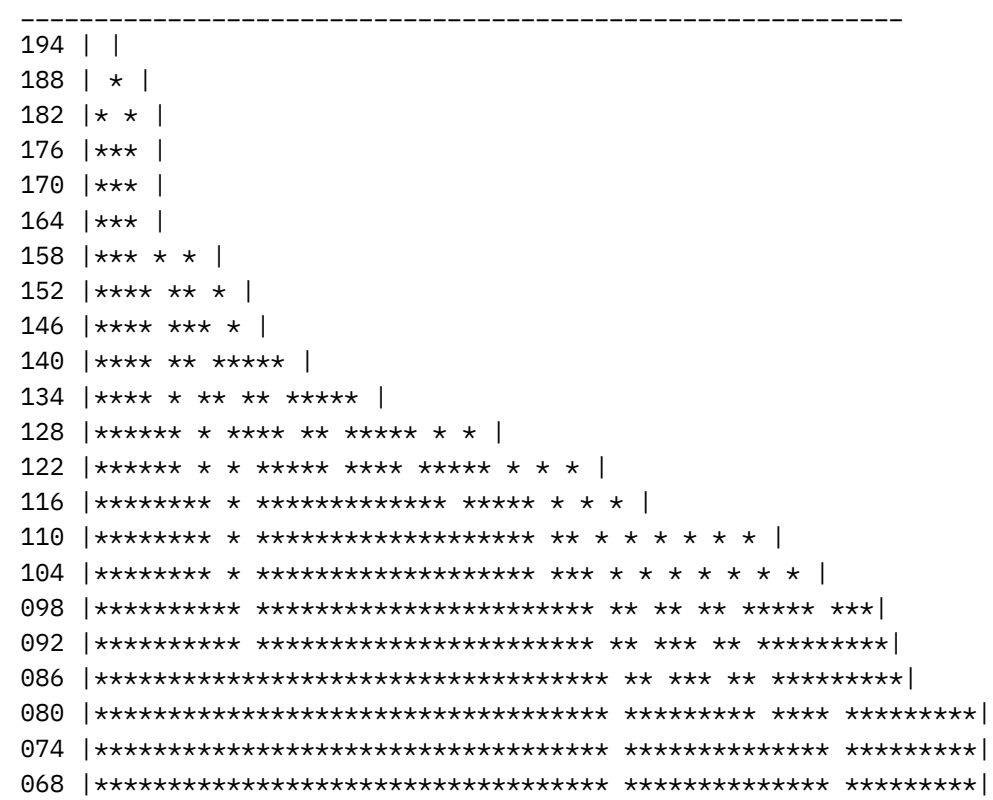
112 |************************************************************|
------------------------------------------------------------
```

Chart Start: Day #038

GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS



```
062 |************************************************************|
-------------------------------------------------------------
Chart Start: Day #038
```

NOTES:
The graphical chart of sunspot numbers is created from the
daily sunspot number counts as reported by the SESC.

andyw@aspen32.cray.com (Andy Warner) writes:

>FWIW - I also think .info was a total waste of time, Paul Schleck (apologies
>if I mis-spelt your name) explained the rationale to me ("kill file hack").
>I still can't hack my kill file to make it work, and I suspect there
>are many more like me...

You've spelled it right. What newsreader are you using? The ability to
kill articles cross-posted to a certain group is a hallowed feature on
most major newsreaders.

In rn, according to Leanne Phillips in her rn kill-file FAQ, add a line of
the form:

/Newsgroups:.*[,]rec\.radio\.info/h:j

either in News/KILL (if you don't want to see rec.radio.info articles
anywhere) or News/rec/radio/amateur/misc/KILL (if you don't want to see
them in rec.radio.amateur.misc). The latter method means your kill file
will only be consulted during rec.radio.amateur.misc (and hence runs
more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

rec.radio.info:!s/:^

in .nn/kill (if you don't want to see rec.radio.info articles anywhere),
or put the following lines:

sequence
rec.radio.info
rec.radio.

at the end of .nn/init in order to see all the rec.radio.info bulletins
first, then read rec.radio.amateur.misc without the bulletins.

Personally, I read rec.radio.info, and use the sequence technique with:

rec.radio.info:!n:Cary Oler

in my .nn/kill file (nothing personal Cary, just not interested in Solar
Reports :-).

I'd certainly be willing to work with anyone who wants to set up such a
scheme to customize their presentation of the rec.radio.* groups,
even if they are using a reader other than nn or rn (rec.radio.* groups
only, please, I don't have time to give kill-file help to the entire
net).

>
>But I notice that the 70 cm band goes from 420-450 MHz. Why don't
>these comercial rigs cover the band? Does most of 70 cm go unused?
>Why?
>
I don't know about any other product lines, but Yaesu's dual-band HTs
(FT-470, which I own, and FT-530, which I occasionally wish I owned :)
cover 430-450 Tx/Rx on the UHF side (plus expanded receive, at least
my 470 receives ~420-470 or so).

As far as I understand, 440-450 is where most all FM activity lives,
which is why the rigs you mentioned (which are all FM-only units if
I'm not mistaken) cover this band. I believe that most 430-440 activity
is weak-signal (i.e. SSB and CW, or is it CW first and then SSB :), and
most multimode rigs cover this chunk of the band. What I do not know
about is 420-430, so I am left to speculate that it is essentially
experimental in use, because I've never heard an actual FM signal
there (and I have no other receiver to cover that band).

One reason that I think I may soon be happy to have the Yaesu is a
new satelite which I believe was called ARSENE, and was to use
FM AFSK (i.e. normal terrestrial) packet, with a 435ish uplink
and a 2-meter downlink :) Now all I need is a 440 amp.

Hope it helps, hope somebody else can tell us what, if anything
happens on 420-430, and hope somebody knows anything about that
satelite (poor college student trying to play with satelites ;)

617. Radio Controller for Hams, T-Hunts, DTMF decoding, etc.

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 02:15:29 UTC
From: Asako.Mariather.Kurosaka-Black@f716.n109.z1.his.com
Message-ID: <734345121.AA00788@his.com>
Source record: 283380

Organization: University of California, Irvine

Marty, N6ZAV and I have recently developed a multi-function radio controller kit for amateurs, RaCon 6805. The device is based on the Motorola 6805C8 mirco-controller chip. Along with the CPU, it has a MAX232 serial interface for communicating with PC's, a DTMF decoder for remote controlling, and a couple other IC's. RaCon also has a TNC like interface for interfacing to the microphone and speaker ports of connected transciever, as well as PTT management. We also have 16 binary I/O lines going from the chip to a generic data port for future expansion. Several functions are burned onto the 6805 chip, which are jumper, serial, or DTMF selectable.

Our first goal was to build a fox box controller. This would allow a T-hunter to hide this box, along with a radio somewhere remote (in a tree or a box), and remotely control transmissions with a second radio. RaCon has DTMF programmable callsign, tone sequences, and duty cycles. The callsign of the owner of the kit is burned into the chip. It also has the ability to audio repeat the incoming audio back out to the transmitter, so you can "talk through" the hidden T. It also has security features to prevent unauthorized controlling.

The next function we built was a DTMF decoder, which took incoming audio from the radio (or even a scanner), and sent an ASCII representation out the serial port to a computer. Fun and useful. Then, we made a CW (actually Modulated CW) Keyer which took incoming serial characters, and sent corresponding Morse code characters out the radio port. RaCon handles the PTT line, so you just type. It can be used to send code practice, or engage in a CW QSO with a friend. Next, we made a DTMF Controller, which took DTMF commands to control the state of the 8 binary output lines on the CPU. These lines could be connected to relays to allow remote controlling of external devices.

The final function we have created, so far, is an Auto Pager. Most of my local ham friends have pagers, and we frequently page each other to frequencies, rather than phone numbers. The Auto Pager listens to incoming DTMF commands and then, with a modem connected through a null modem cable on the serial port, dials a pager company and sends a message. For example, if I dial "#2125" on the frequency the Auto Pager is set up to monitor (could even be a repeater), RaCon will dial Marty's pager, and send a message that I want to meet him on "146.895".

What all this leads to is this: Has anyone ever done anything like this before? Can you think of anymore functionallity we can add to our existing functions? Can you think of any more functions we can add that would use the hardware we have on the board (DTMF, serial, etc)? Can you think of any new hardware modules we could add to the data port to inprove functionallity (we have been thinking of a DTMF encoder, a phone interface, and an antenna switch)? Do you have any comments at all?

The kits cost $79, and come with everything but a chassis, and cables. If you are interested in one, want more info, or have feedback, e-mail me. Thanks & 73.

SB SPACE ARL ARLS015
ARLS015 SAREX LAUNCH

STS-56/ATLAS-02 MISSION

THE SPACE SHUTTLE DISCOVERY LIFTED OFF ON APRIL 8, AT 0529 UTC (0129
EDT) INTO CLEAR FLORIDA SKIES. THE SHUTTLE CARRIES NASA'S
ATMOSPHERIC LABORATORY FOR APPLICATIONS AND SCIENCE-2 (ATLAS-02),
AND HAS BEEN DESIGNATED A ''MISSION TO PLANET EARTH.''

THE SHUTTLE AMATEUR RADIO EXPERIMENT (SAREX) FLIES AS A SECONDARY
PAYLOAD. THE 5 AMATEUR RADIO-LICENSED CREW ON BOARD DISCOVERY WILL
USE SAREX TO COMMUNICATE WITH HAMS AND STUDENT GROUPS AROUND THE
WORLD. SEVENTEEN SCHOOLS WILL GET A CHANCE FOR A SCHEDULED QSO WITH
THE ASTRONAUTS.

WORLDWIDE VOICE AND PACKET DOWNLINK FREQUENCY IS 145.55 MHZ. THE
DOWNLINK IS A RECEIVE ONLY FREQUENCY. VOICE UPLINK FREQUENCIES ARE
144.91, 144.93, 144.95, 144.97 AND 144.99 MHZ. VOICE UPLINKS IN
EUROPE ARE 144.70, 144.75 AND 144.80 MHZ. PACKET UPLINK IS 144.49
MHZ. CALL SIGN FOR VOICE QSOS WILL BE KB5AWP. USE W5RRR-1 FOR
PACKET.

LISTEN TO GODDARD AMATEUR RADIO CLUB STATION WA3NAN FOR REBROADCAST
OF ALL SHUTTLE AIR-TO-GROUND COMMUNICATIONS ON 3.86, 7.185, 14.295,
21.395, 28.65 AND 147.45 MHZ.

ALL AMATEURS ARE REMINDED TO BE TOLERANT AND COOPERATIVE OF EACH
OTHER'S USE OF FREQUENCIES DURING SAREX ACTIVITIES. SAREX OPERATORS
SHOULD LISTEN BEFORE TRANSMITTING, AND ONLY TRANSMIT WHEN THE
SHUTTLE IS WITHIN RANGE. OTHER USERS SHOULD REMEMBER THAT PASSES
ARE SHORT AND OCCUR ONLY A FEW TIMES EACH DAY OF THE MISSION. ANY
REPORTS OF ACTUAL INTERFERENCE EXPERIENCED ON SHUTTLE FREQUENCIES BY
```

SAREX PARTICIPANTS AND OTHER USERS, AND BACKGROUND INFORMATION,
SHOULD BE SENT TO ARRL.

>are many more like me...

You've spelled it right. What newsreader are you using? The ability to
kill articles cross-posted to a certain group is a hallowed feature on
most major newsreaders.

In rn, according to Leanne Phillips in her rn kill-file FAQ, add a line of
the form:

/Newsgroups:.*[,]rec\.radio\.info/h:j

either in News/KILL (if you don't want to see rec.radio.info articles
anywhere) or News/rec/radio/amateur/misc/KILL (if you don't want to see
them in rec.radio.amateur.misc). The latter method means your kill file
will only be consulted during rec.radio.amateur.misc (and hence runs
more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:

rec.radio.info:!s/:^

in .nn/kill (if you don't want to see rec.radio.info articles anywhere),
or put the following lines:

sequence
rec.radio.info
rec.radio.

at the end of .nn/init in order to see all the rec.radio.info bulletins
first, then read rec.radio.amateur.misc without the bulletins.

Personally, I read rec.radio.info, and use the sequence technique with:

rec.radio.info:!n:Cary Oler

in my .nn/kill file (nothing personal Cary, just not interested in Solar
Reports :-).

I'd certainly be willing to work with anyone who wants to set up such a
scheme to customize their presentation of the rec.radio.* groups,
even if they are using a reader other than nn or rn (rec.radio.* groups
only, please, I don't have time to give kill-file help to the entire

net).

623. Re: rigs for 70 cm band

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 03:54:04 UTC
From: jab0684@ucs.usl.edu
Message-ID: <1993Apr9.035404.4977@usl.edu>
Source record: 283458

Well, David, the Alinco DJ580-T does indeed transmit from 420-450(and beyond)
with the out of band transmit mod(cut blue, and reset cpu). I'm fairly certain
the dr599 will do so as well(dunno the mod on that one.)
As for the reason why these radios are sold only tx from 440-450: I can offer
2.

A radio must be fcc approved and meet certain standards on for the freqs.
on which it can transmit out of box. It might be more costly to meet
these requirements over a greater freq range.(note the frequent disclaimer
of radio companies "Specifications guarnteed only (list a certain range)."

Reson # 2 is that the radios you mentioned above are mostly either handhelds
or mobiles, and are assumed to be used for either repeater,simplex, or packet
communications. These services are covered from 440-450 in the AARL
70cm band plan, if memory serves.

As usual any and all corrections by the more knowledgable are invited :)

>these comercial rigs cover the band? Does most of 70 cm go unused?
>Why?
>
I don't know about any other product lines, but Yaesu's dual-band HTs
(FT-470, which I own, and FT-530, which I occasionally wish I owned :)
cover 430-450 Tx/Rx on the UHF side (plus expanded receive, at least
my 470 receives ~420-470 or so).

As far as I understand, 440-450 is where most all FM activity lives,
which is why the rigs you mentioned (which are all FM-only units if
I'm not mistaken) cover this band. I believe that most 430-440 activity
is weak-signal (i.e. SSB and CW, or is it CW first and then SSB :), and
most multimode rigs cover this chunk of the band. What I do not know
about is 420-430, so I am left to speculate that it is essentially
experimental in use, because I've never heard an actual FM signal
there (and I have no other receiver to cover that band).

One reason that I think I may soon be happy to have the Yaesu is a
new satelite which I believe was called ARSENE, and was to use
FM AFSK (i.e. normal terrestrial) packet, with a 435ish uplink
and a 2-meter downlink :) Now all I need is a 440 amp.

Hope it helps, hope somebody else can tell us what, if anything
happens on 420-430, and hope somebody knows anything about that
satelite (poor college student trying to play with satelites ;)

> during the cross-band full-duplex mode. This is a problem, as mine
> has the D14 installed by the factory. Has anyone tried this mod,
> i.e., cut D14? Does it really work??

Yes. Be careful playing around inside a handheld. Real susceptable to damage
if you get carried away with the old soldering iron, or a big clipper.

On the utility of a crossband modification, I use the mobile rig with the
crossband enabled with my handheld simplex on UHF. 146.670 VHF repeater
on the mobile rig and a simplex UHF frequency on the handheld. Or opposite
If I want to run the mobile rig on a UHF repeater. More this is just a
convenience to be able to run around the property with a HT on low power
and not worry about hitting the machine. On doing this with a handheld, I
would consider it with the HT in the vehicle with a good mobile antenna, and
possibly an amplifier, and then talking to it with another HT as in the
above scenario.

Hello folks,

Here is some info about LARC, the Lambda Amateur Radio Club. I am posting this information at the request of several other folks. This info comes from an informational pamphlet.

LARC is a group of amateur radio operators, short wave listeners, and other interested individuals, all of who are gay men or lesbians. The club exists for the purposes of friendship, support, outreach, public service and promotion of the amateur radio service.

For more info, please send a SASE to: LARC, P.O. Box 24810, Philadelphia, PA, 19130.

> WG1V
> chowe@bbn.com

Well, the repeaters in the area he is planning to go to are rather
sparse, but the repeaters that do exist often provide wide spread
coverage. Here's a list of what was current several years ago, when I was
the VHF coordinator.

Prince George 146.28/88
Quesnel 146.46/147.06
(may now be off the air)
Vanderhoof 146.28/88
Houston 147.66/147.06
Fort Fraser 147.63/147.03
Smithers 146.28/.88
Smithers 146.34/.94
Terrace 146.10/.70
Terrace 146.25/.85
Terrace 146.46/147.06
Prince Rupert 146.28/.88
Prince Rupert 146.34/.94
Prince Rupert 147.88/147.28
Williams Lake 146.02/.62

Williams Lake 146.04/.64
Williams Lake 147.72/147.12

All these are in the form input freq/output freq of the repeater.

And, all these are somewhat off the track for your buddy, although many of these will be in range part of the time.

There is an extensive system of logging company radios, and BC Tel has wide coverage through radio telephone. (Or had, anyway, and I don't think there's much if any cellular up there yet.)

If your buddy wants emergency communications in that area, my suggestion is that he rent a portable VHF rig for BC Tel frequencies. (I don't know where he can do this). This would, I think, give him the broadest coverage.

Robert Smits There is *no* idiotproof filter.

Closer, but still not correct. It means exactly what it looks like.
YL, as in Young Lady, female and single. Ex-young-lady just means no
longer single.

This stuff has been around for years. It seems a shame people haven't
been able to figure it out yet.

ZCZC AE43
QST de W1AW
DX Bulletin 17 ARLD017
>From ARRL Headquarters Newington CT
April 9, 1993
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB DX ARL ALD017
ARLD017 DX news

Thanks to Tedd, KB8NW, the Ohio/Penn PacketCluster Network and the
ARRL DXAC for the items in this week's bulletin.

YEMEN. Pete, K6EDV, reported on a DX net that he and RW4WR, UA4WAE,
UA9MA, UA4WII, possibily ZL1AMO and others will be active as 4W1UA
during the first week of October. Pete mentioned the group has the
licence in hand.

ERITREA. DJ9ZB and friends will be operating as 9F2DX sometime next
week around April 9. QSL via DJ9ZB.

GHANA. The Dutch operators continue to be active signing 9G1AA. It
was reported that they will be there until April 11. CW activity
has been on 1832, 3505, 7005, 10105, 14020, 18075, 21020, 24900 and
28020 kHz; SSB on 1840, 3645/3775/3795, 7045/7080, 14195, 18125,
21295, 24940 and 28395 kHz; and RTTY on 14090, 21090 and 28090 kHz.
The Dutch operators listen for USA stations on 75 and 40 meters on
3800/3810 and 7175/7200 kHz. QSL to Wim Faasen, PA2FAS,
Weeskinderendijk 81, 3314 CM Dordrecht, The Netherlands.

TAIWAN. Joe, N4MQX, will sign BV/N4MQX from April 9 through 20 on
80 through 10 meters, with a possibility of some 6 meter activity.

ETHIOPIA. Timo, OH5MVT, is active as ET3TI. His length of stay is
unknown, but he was heard recently on 7004 kHz at 2130z.

TROMELIN. Henri, FR5ZQ, will be signing FR5ZQ/T for one month.
W2/F2YS is trying to hold a sked on 14256 kHz at 0200z, but has not
been able to raise him on the frequency as of yet. Keep listening.
```

BELARUS REPUBLIC. From June 20 to July 2 the Belarus Republic will be on 6 meters for the very first time. Two German operators, DL5BAC and DJ9YE, received permission to operate with the help of Sergej, UC2AKP, who will also be joining their 6 meter DXpedition. They will operate from KO42 and KO41. Callsigns will be EV5D and EV5K in KO42, and EV5M and EV5N in KO41. Check 50.095, 50.145, 50.165 and 50.215, the 28.885 MHz 6M Net and 14.345 MHz VHF Net. A beacon will run on 50.077 during times of inactivity. QSL via DL5BAC.

NEVIS ISLAND. Look for V47WC, V47RS, and perhaps one other operator to be active from April 28 to May 5. Plans are for 80 through 10 meter CW and SSB, including some WARC band work.to KB8WC. QSLs for CW contacts go via N8LXS.

SAN FELIX. John, XQ0X, was very active on CW, and has been joined by Julio, CE8CWO, a naval CW operator, who has also been passing out CW QSOs from time to time.

LAOS. Hiro, JA2EZD, will be returning to XW-land April 28 to May 8. He will be active as XW2A. Another operator will be joining him and will sign XW6A.

IRAQ. Tomasz, SP5AUC, is now active as YI9CW. QSL via PO Box 11, Warsaw 93, Poland. Activity last weekend was on 15 meters CW between 1330 and 1700z. Other reports earlier this month indicate activity on 40 and 12 meters.

DX ADVISORY COMMITTEE RECOMMENDS NEW COUNTRIES

The ARRL DX Advisory Committee (DXAC) has voted unanimously to recommend that Czechoslovakia be deleted and that the Czech Republic and Slovak Republic be added to the DXCC Countries List.

This recommendation now goes to the ARRL Awards Committee for consideration. Start dates will be announced after Awards Committee action. Please do not send QSL cards to the DXCC desk for these countries until they have been offically added to the list and a date for acceptance has been announced.

DXAC ANNOUNCES VOTE RESULTS

Rule 10 Change

The ARRL DX Advisory Committee (DXAC) voted 14 to 1 to not change DXCC Rule 10 to allow contacts made from a club station to apply to an individual's DXCC award. Committee members saw no compelling reason to change the existing rule.

DXAC News

The committee voted to publicly announce vote results and to keep the Amateur Radio community informed of the issues under consideration by the DXAC. These were presented to the committee as separate issues.

I was at a HamFest a few weeks ago and saw someone selling the RS 2mtr
xcvr for $185. You may want to wait till the next HamFest in your
area. You could even find one used for less. Good luck..

635. Re: Need recommendation on tuner

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 12:12:51 UTC
From: dstock@hpqmoca.sqf.hp.com
Message-ID: <C57txG.EI4@hpqmoea.sqf.hp.com>
Source record: 283399

You can't rate an antenna tuner simply by power.

(Everyone does it, all the adverts do it, But they are misleading)

The limits on a tuner are the capacitors arcing, due to voltage, and
coils etc unsoldering themselves due to current

What power levels these things happen at depends on how the tuner is
set, IE. what the load impedance is, and what Q the atu is running
internally. A typical 1kW unit will easily pass 1kW into 50 ohm
resistive loads (when you don't need an ATU !) but the survivable power
level reduces as the load gets further from the ideal 50 ohm pure R.

Even some of the monster tuners can be damaged at a hundred watts if
they are adjusted to extreme impedances.

You can always get big external meters added to any unit, or even use
a talking DVM unit, You are really only wanting relative indications.

Perhaps a talking power meter/ matching indicator would be a worthy
thing to design. I can manage the RF/analogue, but I've no experience of
speech synths.

Cheers
David GM4ZNX

>
>But I notice that the 70 cm band goes from 420-450 MHz. Why don't
>these comercial rigs cover the band? Does most of 70 cm go unused?
>Why?

The primary FM operating area is 440-450, so you'd expect FM-only
radios to cover only that segment. The 430-440 area is for weak
signal and satellite operations, so most of the SSB/CW radios and
transverters cover this segment. 420-430 is primarily ATV country.
In addition, auxiliary link stations and packet backbones are tucked
away in several parts of the band.

Until fairly recently it was difficult to make a clean radio that
covered the entire band and still had good enough filtering to
keep the commercial crud out of the receiver, and to keep the
transmitter clean and efficient without manual tuning. The advent
of broadband RF power modules, and PIN switched bandpass filters
makes this easier today, but usage patterns are already set.

Chebyshev filter??? This will really mess up the data! You want to
maintain the integrity of the data, but the poor group delay response
of this filter will create alot of intersymbol interference. Surely

a Bessel, FIR or other linear phase filter is what should be used.
(or have I miss-understood the use of this device??)

Date: 1993-04-09 14:03:10 UTC
From: n2ic@druwa.ATT.COM
Message-ID: <24404@drutx.ATT.COM>
Source record: 283485

AI7W says:

>Yes the bands are a shared resource. Let's see there are probably 10 big
>contest a year. Some of them are 48 hours long. Thats about 20 days a year.
>20 days out of 365 days (20/365)=5%.

to which KJ9U/KH6 replies :

> The way I see it, that is 20 weekends a year the entire (SSB|CW)
> half of all HF bands are inundated.

Gee, they must teach math differently in Hawaii. 10 big contests a year
equals 10 weekends.

As an avid contester, I see the following contests as potential "band eaters"

CQWW (CW and Phone) - 2 weekends
ARRL DX (CW and Phone) - 2 weekends
ARRL SS (CW and Phone) - 2 weekends
CQ WPX (CW and Phone) - 2 weekends
IARU - Saturday only of 1 weekend
Field Day (not a contest, according to the ARRL) - 1 weekend

Looks like 9.5 weekends to me !

More gospel from KJ9U/KH6 on the subject of nets:

> We have here dozens of stations SHARING a single frequency, ...

During a major contest, there are THOUSANDS of stations sharing a band.
Why do you think there is so much QRM ?

More wisdom from KJ9U/KH6:

> half of all HF bands are inundated.

Really ? Have you ever heard of 12, 17 and 30 meters ? Or don't you consider
them HF bands ? Have you ever heard those bands "inundated" by a contest ?

Indeed; but "not correct"? Ahem.

The nameless telegrapher's nerdish cuteness motivated him coyly to negate "young" rather than say "old" outright. "Old lady" for "wife" is a still-current usage dating from about 1871. "Young lady" as used between radio operators is itself likely to have originated as a back-formation from "old lady."

-Harris.

THAT tears it! I have heard that arguement more times than I can count
and it is, simply, the most vaccuous, ignorant, ill-informed,
perjorative, prejudicial and idiotic one of them all.

Just to set the record "straight" (with apologies to the gay and
lesbian hams who could probably state their case more eloquently ;^) I
am straight, the father of four (yeah, I know that means nothing, but
some narrow-minded people might actually equate the sperm delivery
process with "manliness", and so I toss it in... ;^) and have been a
ham for 37 years. I am 51 years old...an OLD FART!!! And, I have many
many friends, both social and Ham, who are gay/lesbian. They are HUMAN
BEINGS.

What these people want, Ken (and others) is NOT that you adopt their
"lifestyle", but that you simply accord to them the rights they have
as human beings, and not attempt to diminish them simply because in
your narrow mind and miniscule little heart you can not bring yourself
to be a decent human being and abide by the "live and let live"
principles.

You can look the other way when an advertisement for a missionary net,
or the Jewish hams appears, but leap up in self-righteous fervor and
jump to the conclusion that a simple announcement for a Ham radio
group, wishing to be able to more easily contact each other without
having to ask, on the air, and stir up all you maniacal homophobes,
whether the person they are addressing shares some significant life
pattern.

> please post only to the radio.amateur.policy, or I
> will not respond.
Do everyone a favor, and unless you have something CONSTRUCTIVE to
add, don't jump in simply to demonstrate your manifold intolerance and
bigotry...it doesn't become you...

> Ken M. Edwards, Bell Northern Research, Research Triangle Park, NC
> All opinions are my own and do not necessarily reflect the views of

>phone patch traffic on numerous occasions. This is where I draw the line!

You draw the line before you break the law. So, sorry but no blanket
party, as much fun as that could have been.

What you do is serve this fellow notice after you locate him, by notarized
letter perhaps, with a copy to numerous local, state and federal agencies.
(like FCC, police, EMS, FEMA, whatever.. Remember, your repeater association
or ARC are probably involved with ARES/RACES etc...)

I get a feeling that will put a damper on this individual miscreants
'fun'

What do you think?

* STS-56 LAUNCH SIGHTINGS *
==========================
The Space Shuttle Discovery lit up a significant portion of the Eastern
Coast of the U.S. as it lofted the STS-56 crew into a highly inclined orbit
trajectory. The spectacular night launch occurred on time at 05:28:59.95 UTC
or 1:29 am Eastern Daylight Time on 08-Apr-93.

Individuals as far north as New York saw the Space Shuttle roar up the East
Coast on its nightly trajectory. In the Washington D.C. area, several
people saw the Shuttle for approximately 1 minute as it raced from Southeast
to almost due East. When the shuttle main engines cut off at 8 minutes and
40 seconds into the flight, the Shuttle virtually disappeared from view.

Walt Daniel, N3KVQ, described it as follows:

"I stayed up and watched the skies to the East from the QTH in Annapolis
(Maryland). The launch took place at 1:29 AM EDT on 8 April 1993.
At about 1:36 AM EDT, I saw the Shuttle come into view. It was brighter
than Jupiter and moving pretty quickly (across about 60 degrees of azimuth
in one minute). The elevation never got above 10-15 degrees; if the leaves
had been on the trees, I would not have been able to see it. The most
interesting aspect of the sighting was that I could clearly see the
brightness fade as the Shuttle main engines were shut down (I was listening
to the WA3NAN rebroadcast). The shutoff took place at about 1:37 AM and I
could not see the Shuttle after several seconds."

The STS-56 ATLAS-2 mission will carry out atmospheric investigations of the
Earth's Ozone layer during the planned 9 day flight. Also, on-board as a
secondary payload is the Shuttle Amateur Radio Experiment (SAREX). SAREX
allows school groups and amateur radio operators to talk to the Shuttle Crew
while they are on orbit.

[Info via Frank H. Bauer, KA3HDO of the SAREX working group.]

* STS-56 SAREX INFO *
==========
STS-56 Shuttle Amateur Radio Experiment (SAREX) Information Sheet:

Mission: STS-56 Space Shuttle Discovery
ATLAS-2 Spacelab Mission

Launch: April 8, 1993, 05:28:59.95 UTC

Orbit: 57 degree inclination, 160 nautical miles

Amateur
Radio
Operators: Ken Cameron, KB5AWP, Ken Cockrell, KB5UAH,
Mike Foale, KB5UAC, Ellen Ochoa, KB5TZZ, and
Steve Oswald, KB5YSR

Modes: FM Voice
Prime callsign KB5AWP

Packet Radio
Callsign W5RRR-1

2-way SSTV
Callsign W5RRR/S

ATV Uplink (prescheduled)

Frequencies: All operations in split mode. Do not transmit on
the downlink frequency.

Voice Freqs: Downlink: 145.55 MHz (Worldwide)
Uplinks: 144.91, 144.93, 144.95, 144.97, 144.99
MHz (Except Europe)
144.70, 144.75, 144.80 MHz (Europe only)

Note: the crew will not favor any specific uplink
frequency, so your ability to work the crew will
be the "luck of the draw"

Packet Freqs: Downlink: 145.55 MHz
Uplink: 144.49 MHz

QSL Info: Send you QSL or Listeners Report to:

STS-56 QSL
C/O Vienna Wireless Society
P.O. Box 418
Vienna, VA 22183

Include a self addressed stamped envelope. Non-US stations should
include the appropriate number of IRCs with your QSL or a $0.50
U.S. stamp on the envelope.

Report should include callsign, whether worked/heard, date, UTC time,
mode, frequency, and QSO number for packet connects.

Info: Goddard Amateur Radio Club, WA3NAN, Greenbelt, Maryland
SAREX Bulletins and Shuttle Retransmissions
3860 KHz, 7185 KHz, 14,295 KHz, 21,395 KHz, 28,650 KHz
and 147.45 MHz (FM)

Johnson Space Center ARC, W5RRR, Houston, Texas
SAREX Bulletins
7225 KHz, 14,280 KHz, 21,395 KHz, 28,650 KHz, (SSB)
and 146.64 MHz (FM)

ARRL Amateur Radio Station, W1AW, Newington, CT
SAREX News Bulletins
3990, 7290, 14,290, 18,160, 21,390, and 28,590 KHz
and 147.555 MHz (FM)

Also, bulletins available on internet, via AMSAT ANS,
Compu$erve, and your local PBBS.

School Group Participation: 18 school groups will participate
in SAREX with pre-scheduled direct
contacts. These include 13 in the
U.S., 2 in England, and one in
Portugal, South Africa and Australia.

P.S. I have no commercial ties with Comet, I just use/buy their antennas!

648. DSP-2232 and Kenwood radios

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 15:53:59 UTC
From: phil@hansen1.ncd.com
Message-ID: <17601@lupine.ncd.com>
Source record: 283535

I have been working with my DSP-2232 and I am wondering how others are
connecting them up to their Kenwood radios! I have been using the FIXED
OUTPUT that comes out of the radio and putting this direclty into the DSP-2232

I am afraid that this might be too much audio and is swamping the AGC.
I think this might be happening since when I monitor HF packet the DCD light
stays on all of the time (even when no signal is present, just noise)

I will be happy to collect all responses and post a follow up!

Thanks!

DE KJ6NN

|> But I notice that the 70 cm band goes from 420-450 MHz. Why don't
|> these comercial rigs cover the band? Does most of 70 cm go unused?
|> Why?
|>
|> On other rigs advertised, I could not find any information about what
|> sub portions of the band were covered.

This is just off the top of my head, so don't flame me if it's wrong.

420-426, 426-432: Amateur TV (2 channels)
432-440: Weak signal and satellites (SSB and CW)
440-450: FM simplex and repeaters

The reason the radios you list only cover 440-450 is because they are FM only.
If you look at the all-mode 70cm rigs, such as the Icom 475 or Kenwood 811, they
will cover at least 430-450 Mhz. I believe that AEA sells an ATV transmitter and
receive converter combo that works on the two ATV channels.

> But I notice that the 70 cm band goes from 420-450 MHz. Why don't
> these comercial rigs cover the band?

Because the FM repeaters primarily operate between 440-450 and that's what people primarily want in FM only Mobile radios (My FT470 goes down to 430). Typically to get full coverage you have to look at a multimode UHF rig.

>SM doesn't know about it, contact the Pacific Div Director. Addresses
>and phone numbers are in every issue of QST.

>AL N1AL

I have some bad news for you all, the above will do nothing. The
ARRL and FCC are lazy and don't care or don't want to deal with it.
There I said it, I slandered the gods. Here is the proof, and it
is proof.

A friend of mine and I tracked down a local jammer one evening
with 2 beams and a 440mhz doppler system. We found his exact location
and address. For the next several nights my friend recorded on tape
what this guy was doing and also kept careful logs in a notebook
of his actions, we even managed to get the jammers call at one point.
Then we turned all of this in to the ARRL section manager and
the local FCC field office. We thought we really had this one wrapped up
right? No, what happened is we got heard back from the ARRL saying
they relied on "peer pressure" to take care of these people, and basically
I dont think they even contacted the guy. Then the FCC send a letter saying
they let the FCC handle these problems. Course we told them that we
are tax payers and the FCC's jobs is to handle it because the ARRL has
to authority to really do anything other than call this guy up and
say, "can you please not jam this repeater blah blah blah."

Well, to this day this jammer is still jamming away and can be heard
on almost a nightly basis. So much for the FCC and ARRL. What do these
guys do anyway?

So there you go, dont bother going to the FCC or ARRL about this
jammer, you won't get anywhere.

If anyone wants more info on this, email me and I can provide a
packet address of my buddy who did most of this work and he might
be able to provide you copies of the letters from the ARRL and FCC.

656. 10m is dead?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 18:01:06 UTC
From: a-kevinp@microsoft.COM
Message-ID: <9304091905.AA00201@netmail.microsoft.com>
Source record: 283418

Thats what everyone says -- what they mean is 10m F2 is becoming less
frequent as the flux declines.

But keep in mind:

1. The solar flux becomes very variable from day to day around the
minimum. It can suck bad for several days then open up. The problem
there is there are few people looking for the openings! Listen to the
beacons and call CQ!

2. Sproadic E will always be around during the summer. Just wait for
the right times (and hope there are other 10m enthusiasts out there!).

3. try CW (or a digital mode). Often you can find nothing on SSB but
there is interesting stuff at the low end of the band.

4. go for north-south paths. Forget about over the pole!

5. There is always the mode A (or mode K) Russian satellites if the
band is dead!

This isn't the only group that has been hit with this. The site in question has been reposting ALL articles, changing the Message-ID, and the From address (after the '@' of course).

It may also be the mailer on 'his.com'. I sent mail to news and root on f716.n109.z1.his.com and copied news and root on his.com...I received two messages saying that news was not a valid user and two messages saying that root was not a valid user. So far my mail to postmaster@his.com has not been returned nor have I received a reply from f716.n109.z1.his.com.

If it continues, I will also contact uunet and request they refuse connections from the site until the problem is resolved.

>half of all HF bands are inundated. 40 or 50 percent of PRIME TIME is
>eaten by the "59 12345, QRZ" monster.

Interesting math. I thought week ends were two days long. That's 10
weekends, not 20. Since there are 52 weeks in a year thats about 19%
of the week ends.
You make is sound as though it's not possible to conduct any other
type of QSO during a contest. That's simply not true. (for most of
us, anyway).

>>How about 80m check-in nets. Lets see they're on the entire 80 phone
>>band from 6PM to 9PM (west coast time) 7 days a week. That 3 hours a day
>>for 365 day a year (3*365)=1095 hours. At 24 hours per day that's (1095/
>>24)=45.63 days a year. So at 45 days a year (45/365)=12%.
>
>We have here dozens of stations SHARING a single frequency, maybe even
>enjoying a contact. Certainly not just lying about signal reports
>("You are 59, but I missed your callsign and report.")
>
During the SS contest last year I made 1380 QSO's in 24 hours. That's
about 57 QSO's an hour. If you figure the 80 meter nets last from 6pm
to 9pm (3 hours) that means I had about 172 QSO's during the same period.

Sounds like 172 amateurs SHARED a single frequency. How many nets have
that kind of efficiency?
(I believe all 172 contacts were enjoyable)
(Of course no-one in a net would exaggerate a signal report)

>
>>Regarding limiting contests to certain band segments. It's not a bad idea

>> etc. etc. etc.
>Actually, if the contesting gets much more aggressive, it will be outlawed,

Source record: 283421
Cross-posted to: rec.ham-radio,rec.radio.amateur.misc

Hi all-

I'm a ham'er to be. I've been studying the ARRL book "Now You're Talking with HAM radio" for the last few weeks. I'm almost done reading it all and will start reviewing and studying the questions before I take the test. I'll be taking the Technician FCC exams parts 2 and 3A.

What I would like to know is there a program on the net that will randomly generate sample tests from the official question pool? If not, I was thinking if anyone has the questions in electronic form, that I could write a short program to read in the questions and output sample tests.

If you know of such a program or where an online copy of the question pool is, please email me.

Thanks,

Matthew.

662. April 1993 DXAC Report by NA2M

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 20:08:05 UTC
From: reisert@mast.enet.dec.com
Message-ID: <dxac.txt@ampr.org>
Source record: 283487

DXAC NEWS - APRIL 1993
by Bill Hellman, NA2M

CZECHOSLOVAKIA...N4MM reports that the DXAC balloting was 16-0 to delete Czechoslovakia and add Czechia and Slovakia as 2 new countries. This will be sent to the ARRL Awards Committee for action.

ABU AIL - The DXAC voted to delete Abu Ail and the ARRL Awards committee deleted Abu Ail from the DXCC Countries List retroactively to March 31, 1991.

MOUNT ATHOS. A petition calling for the deletion of Mount Athos has been removed from the DXAC agenda as requested by the petitioner.

NEW PETITION.
A petition has been received from the Southern California DX Club requesting a change in the DXCC Rules as follows:

Point 2, SEPARATION BY WATER
(a) The island or islands are situated off shore, geographically separated by a minimum of 225 miles of open water from a continent, another island or group of islands that makes up any part of the "parent" DXCC country.

The proposal seeks a change to a minimum of 100 miles ...

(b) This point applies to the "second" island or island grouping geographically separated from the "first" DXCC country created under Point 2 (a). For the second island or island grouping to qualify, at least a 500-mile separation of open water from the first is required, as well as meeting the 225-mile requirement of (a) from the "parent". For any subsequent island(s) to qualify, the 500-mile separation would again have to be met. This precludes, for example, using the 225-mile measurement for each of several islands from the parent country to make several DXCC countries.

The proposal would substitute "100 miles" for each of the mileages in the point.

The intent of the SCDXC petition is to increase the number of countries for the pursuit of DX.

NEW PETITION
The DXAC has received a petition from Sam Liu, BV4VB, to approve Pratas Island as a new DXCC Country. Pratas island, also known as Dong-sha Dao, is a territory of the Republic of China. It is located in the South China Sea at 20.42N latitude and 116.43E longitude. The petitioner bases eligibility by Section II, Point 2(a), Separation by Water, of the ARRL DXCC Countries List.

QSL PRACTICES. Letters continue to come in almost daily regarding QSL practices. It's encouraging to see letters from many non-USA clubs and individuals.

DXAC member Bob Parlin, W0SFU, has been replaced by Vern Veen huis, KU0S, representing the Dakota division.

ZCZC AE43
QST de W1AW
DX Bulletin 17 ARLD017
~From ARRL Headquarters
Newington CT April 9, 1993
To all radio amateurs

SB DX ARL ARLD017
ARLD017 DX news

Thanks to Tedd, KB8NW, the Ohio/Penn PacketCluster Network and the ARRL DXAC for the items in this week's bulletin.

YEMEN. Pete, K6EDV, reported on a DX net that he and RW4WR, UA4WAE, UA9MA, UA4WII, possibily ZL1AMO and others will be active as 4W1UA during the first week of October. Pete mentioned the group has the licence in hand.

ERITREA. DJ9ZB and friends will be operating as 9F2DX sometime next week around April 9. QSL via DJ9ZB.

GHANA. The Dutch operators continue to be active signing 9G1AA. It was reported that they will be there until April 11. CW activity has been on 1832, 3505, 7005, 10105, 14020, 18075, 21020, 24900 and 28020 kHz; SSB on 1840, 3645/3775/3795, 7045/7080, 14195, 18125, 21295, 24940 and 28395 kHz; and RTTY on 14090, 21090 and 28090 kHz. The Dutch operators listen for USA stations on 75 and 40 meters on 3800/3810 and 7175/7200 kHz. QSL to Wim Faasen, PA2FAS, Weeskinderendijk 81, 3314 CM Dordrecht, The Netherlands.

TAIWAN. Joe, N4MQX, will sign BV/N4MQX from April 9 through 20 on 80 through 10 meters, with a possibility of some 6 meter activity.

ETHIOPIA. Timo, OH5MVT, is active as ET3TI. His length of stay is unknown, but he was heard recently on 7004 kHz at 2130z.

TROMELIN. Henri, FR5ZQ, will be signing FR5ZQ/T for one month. W2/F2YS is trying to hold a sked on 14256 kHz at 0200z, but has not been able to raise him on the frequency as of yet. Keep listening.

BELARUS REPUBLIC. From June 20 to July 2 the Belarus Republic will be on 6 meters for the very first time. Two German operators, DL5BAC and DJ9YE, received permission to operate with the help of Sergej, UC2AKP, who will also be joining their 6 meter DXpedition. They will operate from KO42 and KO41. Callsigns will be EV5D and EV5K in KO42, and EV5M and EV5N in KO41. Check 50.095, 50.145,

50.165 and 50.215, the 28.885 MHz 6M Net and 14.345 MHz VHF Net. A beacon will run on 50.077 during times of inactivity. QSL via DL5BAC.

NEVIS ISLAND. Look for V47WC, V47RS, and perhaps one other operator to be active from April 28 to May 5. Plans are for 80 through 10 meter CW and SSB, including some WARC band work. QSL SSB contacts to KB8WC. QSLs for CW contacts go via N8LXS.

SAN FELIX. John, XQ0X, was very active on CW, and has been joined by Julio, CE8CWO, a naval CW operator, who has also been passing out CW QSOs from time to time.

LAOS. Hiro, JA2EZD, will be returning to XW-land April 28 to May 8. He will be active as XW2A. Another operator will be joining him and will sign XW6A.

IRAQ. Tomasz, SP5AUC, is now active as YI9CW. QSL via PO Box 11, Warsaw 93, Poland. Activity last weekend was on 15 meters CW between 1330 and 1700z. Other reports earlier this month indicate activity on 40 and 12 meters.

DX ADVISORY COMMITTEE RECOMMENDS NEW COUNTRIES

The ARRL DX Advisory Committee (DXAC) has voted unanimously to recommend that Czechoslovakia be deleted and that the Czech Republic and Slovak Republic be added to the DXCC Countries List.

This recommendation now goes to the ARRL Awards Committee for consideration. Start dates will be announced after Awards Committee action. Please do not send QSL cards to the DXCC desk for these countries until they have been offically added to the list and a date for acceptance has been announced.

DXAC ANNOUNCES VOTE RESULTS

Rule 10 Change

The ARRL DX Advisory Committee (DXAC) voted 14 to 1 to not change DXCC Rule 10 to allow contacts made from a club station to apply to an individual's DXCC award. Committee members saw no compelling reason to change the existing rule.

DXAC News

The committee voted to publicly announce vote results and to keep the Amateur Radio community informed of the issues under consideration by the DXAC. These were presented to the committee as separate issues.

Mail I sent to postmaster@his.com this morning got a prompt &
courteous reply. He's stopped all outbound news feeds until the
problem is fixed. I hope he doesn't get flamed to a crisp for what
turned out to be a genuine error that was quickly corrected.

665. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 20:58:28 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.734389108@afit.af.mil>
Source record: 283423

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

666. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 21:02:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.734389320@afit.af.mil>
Source record: 283422

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

667. Re: IC-24AT Mod Help

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 21:49:07 UTC
From: dts@banyan.com
Message-ID: <C58KLv.843@squam.banyan.com>
Source record: 283425

When you are crossband repeating the VHF repeater to UHF, what frequency do you use on UHF? Are there frequencies specifically allocated in your area as simplex channels on 440 (other than the calling channel 446.000, which I assume you do not use)?

This points to two problems:

1. There is only one FM simplex channel defined in the band plans for 440, and more are needed.

2. Crossband repeaters are REPEATERS and need coordination to use any specific frequency. If you use a crossband repeater capability you should think about writing a letter to your local frequency coordinator to ask where to operate.

Perhaps you are not a _member_ of the ARRL, or perhaps you havn't figured out that QST is the membership journal of the ARRL.

In other words, the ARRL is a public membership organization. It is not owned by any individual.

Further, the League is given special status as a VEC and as a source of delegates for the WARC and IARU by our government, thus they become further distanced from your model of the League as some sort of private enterprise.

Nice try though, but you haven't thought it through very well, now have you?

You know -- I've given this some thought. Maybe the ARRL is biased against gays, maybe not. The bottom line still is that as a publication and the owners of that publication, they have the right to decide what goes in it or not. Now the point here hasn't been whether the ARRL should HAVE to post the LARC ad, but that the ARRL was practicing discrimination based on sexual orientation -- a perfectly legal form of discrimination, and their right btw -- in not doing so. Pass your judgements on that basis.

I assume the 9th Amendment quote is unrelated to the post, otherwise we'd be speaking of also violating the rights of the ARRL to publish what they wanted to and NOT what they didn't want to.

The first thing to do is for all involved in the hunt (the more the merrier) to go knock on the guy's door and have a group spokesman politely tell him something on the order of, "we know what you do and we know who you are". Doesn't always work, but it has in a number of cases. It's worth a try before resorting to more drastic measures.

Actually, I do believe there are quite a few people who think this thread is boring and tiresome and making a big deal out of not much of anything, but then I can't say I've one of them since I am posting here, aren't I? :-)

Believe me - no matter what the subject -- you will always find people who honestly just don't care, and it has nothing to do with WISHING people didn't care ... though you could be right with this previous poster. You sound like you think the whole world is out to get gays. In part you may have some truths to that, but to think that everything revolves about that issue is a little ego-centric.

>>The whole thing reminds me of someone I once saw making a big stink to the
>>manager about the food in a fast food joint. After the guy finally walked out

>
>This is NOT fast food, and YES, I (and other agitating Queers) DO expect
>you to follow us in our demands for Civil Rights, anything less is anti-
>American.

This is NOT about civil rights. Good issue, but wrong context. This is about whether you think and approve/disapprove of the ARRL not allowing LARC to have an ad run in their magazine. No civil rights were violated. If the KKK wants to put an ad in the Advocate, it's up to the discretion of the owners of the Advocate whether or not they will post it or not. They should not be involuntarily forced to do so. I think you are confusing the issues.

Freedom of speech and freedom of the press is about printing what you want as well as selectively NOT printing what you don't want. If you own it, no one should be able to force you to put something in it that you don't want there.

I'm all for the civil rights of gays and lesbians just as everyone else equally deserves in this country, but you have to know the difference between civil rights and individual rights of ownership. Escalating and transforming issues that are not about civil rights into some kind of holy war in the name of civil rights only serves to alienate people from public support and sympathy -- not to mention trivialize and demean the importance and definition of civil rights.

674. Re: Additional TH-78A Info

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-09 23:40:17 UTC
From: paluzzi@pioneer.arc.nasa.gov
Message-ID: <1993Apr9.234017.25165@news.arc.nasa.gov>
Source record: 283480

Speaking of cloning with the TH-78A:

I called Kenwood to find out the format and protocols of the cloning signal which is transmitted over the air. One of the "official" answers, obtained after much pressuring, was "it's a lot of beeps and boops--maybe ascii." A second call to Kenwood Customer Support was not really more productive. They said that divulging this information was tantamount to giving away the microcode for the processor and no one in the Long Beach office knew anything about it--after all it is an undocumented feature.

My question is: Has anyone decoded or understand what is being transmitted by the TH-78A while cloning and how can I decipher the signals? It would be nice to know what information I am transmitting over the air.

Thanks and 73

Roger,

KL7ITI provides the following input in response to your
question of two meter frequencies from Denali. Hope this
helps.

jd--k1zat

"If you can, put the information back on the bulletin board.
No repeaters in Kantishna or Talkeetna.
Mt. McKinley climbers usually use 147.30 (Site Summit above Anchorage)
or 146.52 with Del (KL7JKW) and Rose Mary (KL7LA) in Montana Creek.
Once climbers are above about 14,000 feet the repeater is easily
accessable with an HT. Recommend bringing a quarter wave or 5/8 wave
portable antenna to give additional gain over the normal HR rubber duckie.
As they get up the mountain repeaters in Anchorage and Fairbanks become
accessable. The repeater directory gives a good rundown.
In Anchorage 146.94 is best if you can incode 100Hz PL (the higher
receiver)
Also in the Mat Valley 147.00 + ofset PL 141.3 may be accessable from
the mountain.
Hope this helps. Get further information when you fly into Anchorage.
147.30 is accessable with a 10 to 20 watt mobile in most of the way
along the highway from Anchorage to Talkeetna.
I think Jean may also help climbers from her location in Trapper
Creek but am not sure.
Bill
KL7ITI"

I noted one kind of interesting thing last fall. I was driving between Flagstaff, Az
and Cortez, Co (across the Navajo Reservation), and was scanning both
17m and 10m with the Icom 735 in the car. Both were pretty dead (so it
seemed) - I happened to tune to the UPPER end of 10 and found some
FM repeater activity! First time I'd ever switched the 735 into FM mode.
They were over on the East Coast.

The bottom of the band was totally quiet. So that appeared to be a case
of nobody talking so nobody heard anything.

You're probably correct. As an aside, "old lady" seems quite tame
compared to some monnikers. One ex-Welshman I know calls his wife "the
old trout". I'm not sure if he does so in person, however. :-)

From: DT@cup.portal.com
Message-ID: <79209@cup.portal.com>
Source record: 283495

I also tried calling MFJ three days ago, They told me the antenna would be available in 10-12 weeks. I also asked about their new electronic keyers, they said those would not be available for 4 weeks. It seems they don't keep much of an inventory.

Not really. All the mail is transported by U.S. Postal Service; they merely
accumulate it and repackage it. They are providing only a secretarial
service.

>Anyone else have any luck?

I tested the instructions I wrote into the FAQ and got responses for each request within a few hours or minutes, depending on the traffic levels on their end. Make sure the "From" or "Reply-To" lines in your message will be deliverable when they reach ARRL. Standard Internet addresses or UUCP paths from an Internet site should work fine.

I've written some e-mail responder programs before and it's really frustrating when you get messages you can't reply to... it may not be what happenned in your case but it does happen.

If you still think you did everything right, I'm sure Ed would appreciate an e-mail note so you can work with him to determine the cause of the problem. He may be able to use the info to help anyone with similar problems in the future.

HI!

We're planning a vacation trip to St. Thomas in the US Virgin Islands
this summer. Anyone know anything about ham radio there? Is it worth it
to bring along a 2m HT for example? Are there radio clubs there?

Any info would be appreciated.

This is true. In fact, the was a 'false mod' that would supposedly increse
the receive frequency range that would actually trash your receive
circuits. Do NOT try any mods that you see, unless you can afford a new
radio.

692. fido node regurgitating articles in rec.radio.amateur.*

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-10 17:10:23 UTC
From: jim@n5ial.mythical.com
Message-ID: <1993Apr10.171023.7193@n5ial.mythical.com>
Source record: 283541
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,rec.radio.amateur.policy

please excuse the cross-posting, but I'm seeing this in all 3 r.r.a groups, so in this case, it seems appropriate....my apologies if this isn't a valid assumption (but then, the post actually only gets sent once either way, so it's not as if it generates any extra net.traffic or anything).

it would seem that once again, there is a fido node somewhere that seems to think that the rest of the world wants to see duplicate copies of every single post. anyone know how to handle this?

for example, in rec.radio.amateur.policy (when I finally decided I wasn't imagining things), I saw a post from greg@core.rose.hp.com (Greg Dolkas). a few articles later, guess what....that exact same post is repeated. however, this time the article claims to be from Greg.Dolkas@f716.n109.z1.his.com (Greg Dolkas).

the last time I saw this was about a week ago in comp.os.linux, and it was a fido node that wasn't configured right, or something like that. the symptoms were identical, and just as could quickly become the case here, it was no doubt costing a lot of $$$ for some folks (a high-volume newsgroup is bad enough...but when someone decides to double that volume with duplicate postings, that's *REALLY* bad).

anyone know how to proceed in getting these duplicates stopped?

SO..

What I want to do is get a handheld HAM radio system.. possibly even
a mobile..

I want to be able to talk on it .. but also I want it for emergencies..

I dont know wether I should use 2m or 440mhz or what..
I also dont have a license.. (yet) what type of license do I need for either
of these classes?

And finally I read somewhere something about being able to use a phone through
HAM.. I would appreciate info on that.. (Dont tell me I cant call for pizza
on it.. I understand. NO BUSINESS.. I just want that for emergencies!)

Thanks alot!!!!
(also I am going ot be in the DC area.. so info on calling should be related
to there.. if possible..)

Thanks!

I believe that the lawsuit the national LARC filed against the ARRL was
based on Connecticut anti-discrimination laws. If that's true (and someone
can correct me if I'm not - I've heard all this stuff second-hand at best),
then maybe some civil rights, or at least legal rights, were violated.

>3. How does the real world (with multipath, for example) affect
> this whole issue; that is, in the presence of multipath,
> is more or less deviation better?

DTMF was designed to operate over phone lines meeting Bell System
standards. Our radios were designed for communications quality
speech. The two aren't quite the same and vary from manufacturer
to manufacturer.

This is a ticklish subject. The issues are possible clipping in the
audio limiter stage of the modulator, and phase shifts in the IF
filters. If we stay below 3 kHz with the common radios, we get nice
clean unclipped and undistorted tones. As we approach full modulation,
the possibility of clipping and distortion becomes more real. So
we normally restrict packet and TT tones to about 3 kHz. A bit of
clipping on voice signals adds "punch" and a bit of phase distortion
is tolerable in trade for better adjacent channel rejection, but for
control tones this distortion can cause falsing. There is no recognized
amateur spec for tones, but the rule of thumb is around 3 kHz deviation.

From: brian@ucsd.edu
Message-ID: <1q7oug$k8l@network.ucsd.edu>
Source record: 283515

Commercial practice that I am familiar with is to set deviation to
4.5 kHz peak voice (including PL if any)
500 Hz subaudible
3.5 kHz for signalling tones, including touch-tones.

No doubt ham practice is something else, just on NIH principles.

khj@cs.appstate.edu (Kenneth Jacker) writes:

> I have sent two separate requests for additional information to the ARRL
> Server. So far I have received *nothing* in return.

I've sent about 4 and at least 2 of them(probably all 4) have bounced at
uu.psi.com and generated a message back with a subject line of

Subject: uuxqt cmd (rmail arrlhq!info) status (signal 11, exit 0)

However, instead of arriving as .....!nj8j!ben, they have been arriving
as ....!nj8j!njin!ben, which means that it arrives here and then gets
shipped off towards the local smart mailer with an address of njin!ben.
The only reason I caught it the two times was because this is a
single-user site. Once I saw it in the spool before it got sent on, and
the other time I undeleted it after it was sent on. A note to
postmaster@uu.psi.com resulted in some info good towards trying to figure
out how the return address got mangled, but no info on what the above
subject means. Would anyone more uucp-experienced like to tackle that
question?

701. Telemetry receivers

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-11 01:13:00 UTC
From: olson@locke.mcs.anl.gov
Message-ID: <7344907805204@locke.mcs.anl.gov>
Source record: 283516
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

My wife recently started an internship at a raptor rehabilitation clinic.
The clinic wants to acquire telemetry equipment in preparation for
their acquisition of a peregrine falcon (which they don't want to lose :-).
The transmitters are affordable ($100 each) but the receivers go for
about $800, out of their budget. It seems that it should be relatively
straightforward to either construct a receiver or modify a standard reciever
for telemetry purposes.

Is anyone familiar with this stuff? The transmitters operate at 151, 173,
or 216 MHz, if that is a help.

Thanks in advance for your assistance.

Hello,
I just recently passed the Tech No-Code test (yes, I will be upgrading - but I dont want to get into that now) and I am thinking about buying my first radio. I am looking for a Dual Bander and am leaning heavily toward the Icom IC-W2A. I am looking for any experiences you have had both good and bad. Also things to look for and/or watch out for. And finally if I may, any modifications that can be made to the unit (W2A), to enable any functions like extended range or scanning. I think this is a good radio, it doesnt have some of the features of the Kenwood TH-78A, but it looks and I am told is a solid radio.

I have a friend that runs some packet BBS programs in the Philadelphia area. Just recently, the cable company stopped by to identify that he has been interferring with Channel 18 cable TV. This happens to be the fundamental frequency for the entire 2 meter band. Although the cable company acknowledges that he is completely within the legal limits, he expects that the cable company is getting ready to finger him with his neighbors and start a neighbor-to-neighbor war. The actually problem area seems to be confined to within about 500 to 1000 ft (just a few city blocks from his transmitter). Supposably, the FCC has already been contacted, however, he hasn't seen or heard from any FCC officals yet.

Supposably, the problem has been getting worse, he hasn't changed anything in over a year. I figure that the only way the problem is getting worse is that the cable is degrading, and his packet activity is keeping the packet transmitters on more often. Some of the cable ready televisions may also not have the proper shielding also internally and accepting some of the signal directly.

It seems to me that the cable TV industry decided to use the same frequencies in the cable that are used as many other ham and/or commercial frequencies outside the cable, and now that leakage/acceptance is occuring, they don't know how to deal with the monster they've created, or their irate customers (who probably are demanding refunds).

Has anyone else around the country had a problem like this? If so, please send me some mail (not netnews) about what you had to do to resolve this. The more detail you put in your reply, the more I'll be interested in reading it and passing this on to others that may also benefit by it.

Thanks.

VK2SG RTTY DX Notes, 9 April
VK2SG RTTY DX Notes for week ending 9 April 1993 (BID RTDX0409)

Bill, VK2EG reports that he saw Syd, VK2SG, 4 April. "He is walking
and improving. Hopes to be home after Easter." Thanks Bill,
appreciate the updates and to Syd, God bless, we miss you.

Our information this week came from CE3GDN, DJ3IW and the Central
Europe DX-Cluster Node DB0SPC, I5FLN, N5PSI, PA3FQX, VK2EG, WA1MPB,
W2JGR and the Twin-Cities DX Packet Cluster Network, W5KSI, ZS5S.
Thank you all for your assistance.

709. rec.radio.amateur reorg/RFD discussion summary 4/11

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-11 12:21:36 UTC
From: ikluft@uts.amdahl.com
Message-ID: <bbCg03lmcfJF00@amdahl.uts.amdahl.com>
Source record: 283532
Cross-posted to: news.groups,rec.radio.amateur.misc,rec.radio.amateur.packet,rec.radio.amateur.policy

This article contains 5 subtopics:
Current Status of the Discussion
How to Participate in the Discussion
Summary of RFD proposed newsgroups (Option I)
Summary of RFD proposed newsgroups (Option II)
Notes from the discussion so far

Current Status of the Discussion

The RFD (Request for Discussion) for the reorganization of rec.radio.amateur was posted on March 26 to news.announce.newgroups, news.groups, and all the subgroups of rec.radio.amateur. A summary of the proposed newsgroups can be found later in this article.

We have passed the half-way point in the 30-day discussion period. Current tallies of opinions posted to news.groups are as follows:
in favor: 25 people 93 articles
opposed: 14 people 30 articles
undecided or unclear: 10 people 18 articles
(the "unclear" category only includes replies that were off the subject)

These numbers may seem small by UseNet standards but it has actually been one of the larger of many ongoing discussions on news.groups. Support has been running around the 2-to-1 in favor area since the discussion started. Due to the support expressed, we expect that it will be possible to issue a CFV (Call for Votes) some time after the end of the discussion period, which will conclude on April 26, 1993.

How to Participate in the Discussion

If you have not yet expressed an opinion on the proposed split, you can make it easy on yourself by just replying to this article onto news.groups (the Followup-To line already specifies that for you) and say
I support the reorganization of rec.radio.amateur
or
I do not support the reorganization of rec.radio.amateur

YOUR REPLY MUST BE POSTED TO NEWS.GROUPS IN ORDER TO BE AN OFFICIAL PART OF THE NEWSGROUP CREATION PROCESS. You may cross-post to rec.radio.amateur.misc if you prefer to.

It would be even more helpful, if you support the split of r.r.a.misc, to indicate which option from the RFD that you prefer. It's OK to say you like both. They are summarized below. You can still make things pretty easy for

yourself by only posting
I support the reorganization of rec.radio.amateur (Option I)
or
I support the reorganization of rec.radio.amateur (Option II)
or
I support the reorganization of rec.radio.amateur (either option)

Here's a question to ask yourself as you consider these proposals:
Which proposal would make you more likely to vote for all the newsgroups
when voting time arrives? (Separate concurrent votes will be held for
each newsgroup in accordance with the newsgroup creation guidelines.)

Summary of RFD proposed newsgroups (Option I)

(all groups unmoderated)
Newsgroup name description
--- ---
rec.radio.amateur.misc all Ham radio topics not covered below
i.e. video, stories, humor, new topics
[no modification to existing newsgroup]
rec.radio.amateur.policy regulations & policy issues
[no modification to existing newsgroup]
rec.radio.amateur.digital.misc packet radio & other digital modes
[includes old rec.radio.amateur.packet]
rec.radio.amateur.digital.tcp-ip TCP/IP via packet radio
rec.radio.amateur.operating Operating procedures and questions: DX,
CW, contests, propagation, repeaters
rec.radio.amateur.products manufactured equipment, modifications
rec.radio.amateur.instruction Ham radio instruction & examination
rec.radio.amateur.construction homebrewing & experimentation
rec.radio.amateur.space amateur radio in space: satellites,
earth-moon-earth (EME), shuttle, MIR
rec.radio.amateur.emerg-services emergency services: RACES, ARES, NTS

Summary of RFD proposed newsgroups (Option II - "the .tech option")

(all groups unmoderated)

construction, theory, examinations,
video

Notes from the discussion so far

The following notes may help you determine if any suggestions you are considering have already been discussed. Your opinion is important so be sure to show your support or opposition and make any suggestions you believe would help make this a better, more successful proposal.

* There has been strong agreement that r.r.a.misc has too much traffic.
* One of the main points made by those opposing the split has been a concern that there may be a lot of cross-posting of articles across the proposed newsgroups. r.r.a.policy was commonly used as an example.
* Rebuttal to the cross-posting argument pointed out that even in r.r.a.policy there is currently very little cross-posting. With numbers to show this was a misconception, one person withdrew opposition and began supporting the split.
* A point made by proponents of the split was that r.r.a.policy is not a good comparison. All the proposed newsgroups were modeled after r.r.a.packet, which was made for a subject that many Hams are interested in. r.r.a.policy was just a place to throw away an unwanted subject. Still others said that r.r.a.policy has plenty of ongoing policy-related discussion and has also worked pretty well.
* On the subject of cross-posting, there has been some discussion about a netiquette guide like that found on rec.aviation for the past several years. The idea may be considered regardless of the result of the vote.
* Some concern was expressed by both supporters and opposers about the Info-Hams mail list. A common concern was that the mail lists will need to match the newsgroups in order for this to work. Comments from Brian Kantor indicated a wait-and-see position. He did not rule out making new mail lists if the newsgroups pass but he is understandably not enthusiastic since he has plenty of other work to do.
* Two people questioned why the proposal includes making a subhierarchy for r.r.a.digital.misc and r.r.a.digital.tcp-ip. It was pointed out that these were requested by users of r.r.a.packet due to the explosion of new digital modes. There has been no opposition from the r.r.a.packet community.
* Most people supporting the split have not indicated which option (I or II) they support. It was noted that it's been difficult to determine which will be the most-likely-to-succeed choice to put on the CFV.
* Those who prefer Option I seem to do so because the newsgroup names are clearer and more focused. It was said that r.r.a.tech is too general to differentiate itself significantly from r.r.a.misc. So the advantage is that Option I avoids some confusion. (Option I adds 7 newsgroups)
* Those who prefer Option II (r.r.a.tech) seem to do so because it has fewer newsgroups than Option I while still offering an area for technical discussion away from r.r.a.misc. So the advantage is that Option II is not as large an increase in newsgroups. (Option II adds 5 newsgroups)
* A preference was stated to change r.r.a.products to r.r.a.equipment. Rebuttals said that would be confusing next to r.r.a.construction. The

suggestion did not have enough support to be added to the proposal.
* A preference was stated to change r.r.a.construction to r.r.a.homebrewing. Rebuttals said that the name would not be clear enough to outsiders or newcomers. The suggestion did not have enough support to be added to the proposal.
* A preference was stated to change r.r.a.operating to r.r.a.dx. Rebuttals said this would eliminate coverage for many other aspects of operating a radio. (Notably, UHF/VHF repeaters.) Also, this was considered on the rra-reorg mail list prior to the RFD, where DX and repeaters were combined to make r.r.a.operating. Another suggestion was to add r.r.a.dx alongside r.r.a.operating. The suggestion does not appear to have enough support but some discussion may continue.
* A preference was stated to add an r.r.a.bulletins newsgroup. No replies were made to a subsequent poll on the subject so the suggestion is assumed to have insufficient support. One problem was noted that it mostly overlaps rec.radio.info which serves all of rec.radio, including rec.radio.amateur.*.
* A couple articles suggested adding an r.r.a.flame newsgroup. Most participants seem to have assumed that was said tongue-in-cheek. It has not been taken seriously.
* r.r.a.space appears to have significant support. It will probably be on the CFV (call for votes) whether Option I or II is selected as the final model. It was noted that this will mean that Option II will add 6 newsgroups instead of 5. (r.r.a.space was previously only on Option I.)
* A suggestion was made to add an RDF (radio direction finding) newsgroup to the proposal. The original suggestion was to call it r.r.a.jamming. Another article suggested a clearer name of r.r.a.rdf. An opposing opinion said there is not enough traffic to make a separate newsgroup for this topic. This subject is not done being discussed but does not yet have enough support in the discussion to add it to the proposal.

Speaking of wanting jammers in the slammer, we have several in this area
I would like to catch. Can anyone recommend some decent Doppler direction
finding equipment?

You are right -- it's entirely the cable TV company's responsibility to keep unwanted signals out of the cable. The cable frequencies are the same as frequencies allocated to other things outside the cable.

If the cable company is picking up unwanted signals, the cable company is also _emitting_ unwanted signals (through the same holes), and thus is in violation of FCC regulations.

>I would like to catch. Can anyone recommend some decent Doppler direction
>finding equipment?

Commerical doppler units run about $800.00-$1000.00. We build
one for about $100.00 but is was so much of a pain in the a** to
get it working that I would probably never build another one. You
should be able to track the jammers down with nothing more than
a yagi if they are on the air that much.

Message-ID: <1q9skk$p39@usenet.INS.CWRU.Edu>
Source record: 283539

I live in the Great Lakes area, and as such we are restricted to only one ATV frequency on 440, ie: 439.25. (Remember from your Tech test that this is due to the Canadian/US "A-line" restriction disallowing any amateur work on 400-430Mhz.) By being this bound, we can not really enjoy ATV here. One simplex freq on 440, and the 1.2GHz rigs are really very expensive. What we need is an ATV repeater in this area.

That brings me to my question. I would like to set up a repeater on 910MHZ using the "Rabbit" - the video rebroadcaster thingee. I have heard of a club in Austin, TX who has done this, and I would like to get in touch to find out exactly how it was done. Does anyone know the name and address of the licensed trustee of the club? Or at least the name/address (internet address) of one of its members. Please respond as I would like to do this by the end of this summer, if possible. Thanks. 73 de N8MGU

: frequencies outside the cable, and now that leakage/acceptance is occuring,
: they don't know how to deal with the monster they've created,
: or their irate customers (who probably are demanding refunds).

I think the cable company has it backwards (as usual). The cable companies
were allowed use of frequencies currently allocated to other services
on the condition that they not cause harmful interference to those
services and that they accept any interference caused by legitimate
users of those services. If your friends signal is getting into the local
cable distribution network it indicates that the cable company is not
properly maintaining their system. It also means that their cable system
may be exceeding FCC limits on cable leakage. The FCC has been cracking
down on cable systems that have excessive leakage, esp. in the aviation
bands.

STS-56/SAREX MISSION A GO!

HR AMSAT NEWS SERVICE BULLETIN 100.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 10, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-100.01

STS-56 SAREX Mission Lift-Off Described As Spectacular

The STS-56 Space Shuttle Discovery made a spectacular night time lift off on 08-APR-93 at 05:28:59.95 UTC. As STS-56 worked its way north along the East Coast for its high inclination orbit (57 deg), N3KVQ reported that from his Annapolis, MD QTH he was able to see Discovery come into view and streak across the night sky. N3KVQ noted that the Shuttle Discovery appeared to be as bright at the planet Jupiter because he was observing the Shuttle's three main engines. Once the main engines shut-down, N3KVQ reported that STS-56 disappeared into the night sky. At the same time, the radio amateurs at the club station of the Goddard Space Flight Center (GSFC), WA3NAN, noted that they too saw STS-56 fly past their QTH. N8FGV noted that STS-56 looked like a comet streaking across the sky.

With all systems working nominally aboard STS-56, including the Shuttle Amateur Radio Experiment (SAREX), all amateurs are invited to make contacts with the all ham crew of STS-56. For review, the following table summarizes the important frequency information for this SAREX mission.

SAREX Frequencies Shuttle Downlink Shuttle Uplink
Frequencies 2M FM Voice
Frequencies

U.S., Africa, 145.550 MHz 144.9949 MHz
South America, 145.550 144.9700
& Asia 145.550 144.9500
145.550 144.9300
145.550 144.9100

Europe 145.550 MHz 144.800 MHz
145.550 144.750
145.550 144.700

AT NO TIME, SHOULD YOU EVER TRANSMIT ON THE SAREX DOWNLINK FREQUENCY OF 145.550 MHz. The packet uplink frequency will be 144.490 MHz and the downlink frequency will again be 145.550 MHz. The astronauts wish to remind those on the ground to wait until the Shuttle Discovery is a few degrees above the horizon so that you can hear the operator announce which uplink frequency is being used. At no time will the crew of STS-56 favor

any particular frequency so your chance of making a connact will be based on the "luck of the draw."

The primary callsign to be used for the 2M FM voice contacts will be that of Ken Cameron (KB5AWP). The callsign for the packet station will be W5RRR-1 which many will recognize as the the callsign for the Johnson Spaceflight Center's (JSC) radio club of W5RRR. Likewise, the callsign to be used during SSTV operations will be W5RRR/S. The ATV contacts will only be made on prearranged schedules.

[The ANS would like to thank Frank Bauer (KA3HDO) of the SAREX Working Group for this bulletin item.]

AMSAT, ARRL, WA3NAN, And W5RRR To Provide Up-To-The-Minute Information

During the STS-56 SAREX mission radio amateurs can get up-to-the-minute information about the SAREX operations from the AMSAT News Service (ANS) bulletins and the many weekly AMSAT HF and VHF nets around the world. Also, the Goddard Amateur Radio Club in Greenbelt, MD will re-broadcast the shuttle voice audio as it has done on past SAREX missions. Included in these broadcasts will be the latest keplerian element set so that radio amateurs can predict Acquision-of-Signal (AOS) and Loss-of-Signal (LOS) times for STS-56. Likewise, the John Spaceflight Center (JSC) radio club, W5RRR, will also be a source for SAREX information. The following is the list of HF and VHF frequencies that radio amateurs can tune in on to find out the latest status of STS-56.

GSFC ARC WA3NAN Planned HF Operating Frequencies For SAREX Bulletins

3.860 MHz 7.185 MHz [Note: If you live in the Greenbelt, MD
14.295 Mhz 21.395 MHz or Washington, DC area, you can listen
28.650 Mhz to WA3NAN re-broadcast on 147.450 MHz.]

JSC ARC W5RRR Planned HF Operating Frequencies For SAREX Bulletins

7.225 MHz 28.650 MHz [Note: If you live in the Houston, TX
14.280 Mhz area, you can listen W5RRR's shuttle
21.395 Mhz re-broadcast on 146.640 MHz.]

Also, the ARRL's station, W1AW, will provide SAREX mission bulletins and keplerian elements during its daily bulletin broadcasts. See this months QST for information on the times and frequencies for W1AW's bulletin broadcasts. If you would like to find out about the technical details of the various scientific payloads on this particular shuttle mission, you are invited to call into the JSC landline BBS. To connect to the JSC BBS, use

1200 baud with 8 bits, no parity, and one stop bit, (8-N-1 1200 baud), and dial (713) 483-2500 then type 62511.

[The AMSAT News Service (ANS) would like to thank Frank Bauer (KA3HDO) for this bulletin item.]

AMSAT OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 100.05 FROM AMSAT HQ
SILVER SPRING, MD APRIL 10, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-100.05

AMSAT Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B Nets are conducted on an AO-13 on a downlink frequency of 145.950 MHz and Mode J/L
on a downlink of 435.970 MHz.

Date UTC Mode Phs NCS Alt NCS

19-Apr-93 0130 B 95 WB6LLO WA5ZIB
24-Apr-93 1730 B 65 WA5ZIB WJ9F
2-May-93 0000 J 135 W9ODI N7NQM

Any stations with information on current events would be most welcome. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations are encouraged to join the OPS Nets. In the unlikely event that either the Net Control Station (NCS) or the alternate do not call on frequency, any participant is invited to act as the NCS.

****

Slow Scan Television on AO-13

SSTV sessions will be held on UTC Saturdays and Sundays:
Mode J Downlink 435.980 MHz
Mode B after J Downlink 145.960 MHz

OPS NETS will take priority, look for SSTV activity immediately after the net. SSTVer's are invited to join the Net to make schedules at other times if desired.

AO-21/RS-14 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 100.06 FROM AMSAT HQ
SILVER SPRING, MD APRIL 10, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-100.06

PY2BJO Provides First Status Report Of AO-21/RS-14 Digi-Talker Activities

This is the first BRAMSAT Status Report for AO-21, an amateur radio satellite, designed and built by radio amateurs to be used by all those who are interested in the satellite communications, be they amateurs, SWLs or not.

First, BRAMSAT would like to thank all who have taken the time to observe and listened to the "Oscar 21" signals, as well as to be sending us your signal reports. We are extremely grateful and surprised by the hundreds of letters and QSLs sent by such a large number of HAMs, SWLs, young students, and non-technical listeners who are intrigued by the signals, the digital voice mesages, and its telemetry. Some, with QSLs and letters, have presented us with suggestions, and others with comments and a large number asking for technical information concerning AO-21. From this point now, BRAMSAT intends to publish monthly status reports informing all about the news on "Oscar 21".

As of the day of this report, 07-APR-93, we have received more than 500 QSLs and letters from over 26 countries, and from the first 234 QSLs received we are extracting words, which for us, are words of enthusiasm, eulogy and encouragement.

As we have noted that most of the QSLs are asking for information about AO-21, but there are also a large number of listeners which are passing along to us greetings and praise for our initiative with AO-21. Such greetings and eulogy are also extendend in letters, QSLs, and reports to AMSAT-DL and AMSAT-UA groups for their initiative in making this satellite available for use to all the people of the world. A small number of the correspondences have presented us with suggestions, as we requested in our digi-voice message, for the use of the "Oscar 21" digi-talker. BRAMSAT would like to hear from all those who hear the signals from AO-21 and we encourage you to send us your suggestions and ideas for other applications of this satellite.

In reading the letters which have reached us, it is our impression is that this application of AO-21's digi-talker is a big success, but we wish to discover what is the right way to use this valuable resource, and we feel that this will can only be accomplished through the inputs of all those which want to be involved in the matter. In short, we are looking for ideas from of our listeners.

Many of the letters we have received have come from children. Some have listened to the AO-21 signals on their father's or grandfather's radios. At BRAMSAT, we consider the letters from the children to be very special and each child will receive a special correspondence from BRAMSAT. We feel

that we must to encourage and help children to discover the exciting world of amateur radio.

Some of the listeners have asked us for photos of AO-21. We are requesting the pictures from the Support Team in Germany and in Russia in order to that we can respond to this request. All those that have requested a photo of AO-21 can expect one to be sent soon.

With the following technical information, we will try to pass along the general information about AO-21/RS-14 and its modes of operation. However, you can find more technical information in the Oscar News (AMSAT-UK journal), and Oscar Satellite Report (R. Myers Communications - USA) references listed at the end.

[The AMSAT News Service would like to thank PY2BJO for this bulletin item.]

AO-21/RS-14 FREQUENCY INFO

HR AMSAT NEWS SERVICE BULLETIN 100.07 FROM AMSAT HQ
SILVER SPRING, MD APRIL 10, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-100.07

AO-21/RS-14 Frequency & Modes Summary

AO-21/RS-14 is a Low Earth Orbit (LEO) satellite. It is orbiting the Earth at an altitude of 1000 KM, positioned at an inclination of 83 degrees, almost polar orbit, with perigee of 958 KM and apogee of abouth 1000 KM. The orbital period is about 105 minutes, the visibility window of about 15 to 20 minutes and 797 days have past since it was launched "piggy-back" onboard of the Russian Geological Research Satellite (GEOS), also know as INFORMATOR-1 which is the host satellite, from the North Cosmodrome of Plesetsk, Russia, using a Russian launcher. It was made jointly by efforts of AMSAT DL and AMSAT-U-ORBITA - now AMSAT-UA, Russia.

AO-21/RS-14/RADIO M-1 is the designation of the amateur satelite. AO-21 says AMSAT-OSCAR-21, and its number means it is the twenty-first bird launched by amateurs; RS-14 is Radio Sputnik -- the name it received once in orbit -- as the Russians call their amateur satellites. M-1 is because it is the first joint project AMSAT-DL and AMSAT-U-ORBITA. Finally "M" is due to the fact that the Team Group involved are located at Molodechno, near Minsk. RUDAK is the call sign for packet radio operations.

"RUDAK" describes the concept of "Regenerating Transponder for Digital Amateur Radio Communications".

Regenerating means that all signals received are merely retransmited on another frequency, but they are demodulated down to the data stream level. In addition to several other advantages, a complete segregation of the up and down-link is achieved. The links can optimized and the data stream can be processed in onboard computers or other intelligent processing.

This particular aspect is important on the scope of the RUDAK experiment.

The needed uplink power at 435 MHz is about 100 watts EIRP, but in fact as few as 10 watts is usually suffice. On the downlink, 145 MHz, the power output is 10 watts. It is important to point out that the AO-21/RS-14 draws it's power from the host GEOS satellite.

It is using a linear polarized dipole antenna for transmission on 145 MHz and right hand circular polarized Helix receiving antenna for 435MHz.

RUDAK-2 is a digital transponder digipeater that utilizes the AX.25 protocol to "store-and-forward" packet radio communications, and is also a telecommunications experiment with digital signal processor and 1 MByte of RAM disk space.

The Uplink frequency for this system are:

RX-2 435.155 MHz (AFC) 2400 bps, BPSK, Biphase-s
RX-3a 435.193 MHz (AFC) 4800 bps, RSM
RX-3b 435.193 MHz (AFC) 9600 bps, RSM
RX-4 435.041 MHz (Digital AFC) RX for RTX-DSP

The downlink frequency is on 145.987 MHz - 3 watts of RF output produces a strong signal. This downlink can be switched to several different operating modes given below:

Mode 1 1200 bps, BPSK, NRZI, (NRZ-S), Link Pacsat/FO-20
Mode 2 400 bps, BPSK, Biphase-S, (like AO-13's beacon)
Mode 3 2400 bps, BPSK, Biphase-S
Mode 4 4800 bps, RSM, NRZIC, (Biphase-M) (as 4800 bps uplink)
Mode 5 9600 bps, RSM, NRZI (NRZ-S)+Scramble (as 9600 bps u/l)
Mode 6 CW (used only for special events)
Mode 7 FSK (F1 or F2B) e.g.: RTTY, FAX, SSTV, etc., (this is used normally for special events)
Mode 8 FM modulated using D/A signals from DSP-RISC processor.

In this latter mode on RUDAK Uplink #1 that is providing the present 435.016 MHz Up to 145.987 MHz Down FM speech transponder facilities that we are now hearing for most of the time of a pass. Although centered in 435.016 MHz, the Uplink varies from 435.007 MHz at the AOS (Acquisition of Signal) through 435.025 MHz at LOS (Loss of Signal) time. And the nominal downlink frequency of 145.987 MHz varies from 145.990 MHz at AOS to 145.984 MHz on a maximum elevation pass.

This system, like any conventional FM repeater, does not support multiples stations at one time. This will require that only two station be talking each time. Thus, to avoid unnecessary QRM and loss of oportunity to many others operators, many of them with low power -- mobiles, portable stations with less than 10 watts -- so that they will have a chance for a two-way contact via AO-21/RS-14, we strongly recommend that stations using the "Oscar 21" avoid the use of high power. Some non-amateur stations in 70 cm band were noted as causing false command problems, which subsequently caused the automatic switching of the -12 dB attenuator on the receive input.

On the other hand, without attenuator it would not be possible to make contacts between Europe and USA.

The "Oscar 21" transponders are operationally active in various modes, as described below:

Transponder #1

Mode B Uplink 435.022 - 435.102 MHz SSB, CW.
Mode B Downlink 145.852 - 145.932 MHz SSB, CW inverting.

Beacons 145.822 MHz CW. 145.952 MHz BPSK FM 1100 bps
145.983 MHz BPSK/SSB

Transponder #2

Mode B Uplink 435.043 - 435.123 MHz SSB, CW
Mode B Downlink 145.866 - 145.946 Mhz SSB, CW inverting

Beacons 145.948 MHz CW. 145.838 MHz BPSK/FM 1100 bps
145.800 MHz BPSK/FM.

RUDAK-2 Transponder

Uplink 1 435.016 MHz 1200 bps Manchester AFSK/FM
Uplink 2 435.155 MHz 2400 bps BPSK/FM
Uplink 3A 435.193 MHz 4800 bps BPSK/FM
Uplink 3B 435.193 MHz 9600 bps BPSK/FM
Uplink 4 435.041 MHz Digital Signal Processor Input
Downlink 145.983 MHz (Various modes).

Mode 1 Pacsat/FO-20 Compatible
Mode 2 AO-13 400 bps BPSK Compatible
Mode 3 AO-13 RUDAK I Compatible
Mode 4 4800 bps
Mode 5 9600 bps
Mode 6 CW
Mode 7 FSK (F1 or F2B) RTTY, FAX, SSTV, etc.
Mode 8 FM using D/A converter and DSP output.

"One reason you want to go listen to OSCAR 21, if you haven't already done so, is because as an experimental bird, it may switch off this Mode any time." "There are other experiments aboard the spacecraft that will cause a need for the Mode to change to another one of the eight Modes of capability. (OSCAR Satellite Report # 252, Sept. 01 1992).

As was mentioned in the OSCAR Satellite Report -- OSR #251/252, it can be used for bulletins, news, educational purposes, emergency traffic. References to AO-21/RS14 are made in the OSR #259, DEC/1992.

Detailed informations can also be found in find Oscar Satellite Report # 251, 252, 259, among others, which you can from R. Myers Communications P.O. Box 17108, Fountain Hills, AZ - USA, and in OSCAR NEWS # 85 OCT/1990, # 87 FEB/1991 and 99 FEB/1993 (AMSAT-UK journal) that you can try to get

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 100.08 FROM AMSAT HQ
SILVER SPRING, MD APRIL 10, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-100.08

Weekly OSCAR Status Reports: 03-APR-93

AO-13:
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 Mar 22 - May 10
Mode-B : MA 0 to MA 90 !
Mode-BS : MA 90 to MA 120 !<- Mode-S Transponder;Mode-B Transponder is ON
Mode-S : MA 120 to MA 130 !<- Mode-S Transponder;Mode-B Transponder is OFF
Mode-LS : MA 130 to MA 135 !<- Mode-S Beacon + Mode-L Transponder
Mode-JL : MA 135 to MA 150 ! Blon/Blat 180/0
Mode-B : MA 150 to MA 256 ! Move S/C attitude to 210/0 on 10-May-93

Please don't uplink to the Mode-B transponder during MA 120-130. Your
uplink
transmissions will interfere with Mode-S users. Inorder to further encour-
age Mode-S enthusiasts and the use of the AO-13's Mode-S transponder, Mode-
S is now ON for an additional 30 MA units, i.e. MA 90 to MA 135. During MA
90-120 you will have to endure the coupling from Mode-B users operating at
145.880-145.920 MHz. Either work between them, or use their signals as
test signals. MA 120-130 is a Mode-S transponder exclusive (plus Mode-B
beacon). MA 130-135 is Mode-S beacon (plus Mode-L transponder).
[G3RUH/VK5AGR/DB2OS]

FO-20: The FO-20 ground control station, JJ1ZUT, announced that FO-20

operational schedule during April is follows:

Analog Mode Operation:
07-APR-93 09:52 UTC <---> 08-APR-93 10:12 UTC
21-APR-93 10:45 UTC <---> 22-APR-93 11:00 UTC

High Speed Telemetry Collection Mode Of Operation:
12-APR-93 11:30 UTC <---> 19-APR-93 11:53 UTC

During the high speed telemetry collection period, FO-20's mailbox BBS is
closed, however, FO-20 is available as a digipeater. The digital mode will
be in operation unless otherwise noted above. [Kazu Sakamoto, JJ1WTK/3]

Hello all I hope someone out in net-land can help me out. I just bought a slightly used Htx-202 radio and I need the book for it. Is someone willing to xerox one and send it to me ? Please ? I can't seem to figure this thing out. I'm able to set channel one but that's it. I need to know how to: set all the channels and how to get it to scan the channels. Thanks in advance for the help.

From: aki+@cs.cmu.edu
Message-ID: <C5CF1w.p9.1@cs.cmu.edu>
Source record: 283546

sorry if i'm posting on the wrong place. but if there are circuit buffs, would you please help me? i already posted on others but have gotten no responses. replies by e-mail would be much appreciated.

i'd appreciate if the net-wisdom could help me identify the following small-signal components and find out their availability...

q1) i'm looking for some transistors:

bc107 (small metal can)
bc141-10 (metal can)

i suppose they are european because of the "bc***" designation.
would anyone in the know please let me know if they are still in production and if so, where i can buy them in small quantity (10~20) ?

q2) also i have a tiny little thing with three pins that i don't know how to identify in the midst of a 20-yr old preamp circuit. it's packaged in white cylindrical (probably) ceramic with black painted round top, looking like a flattened mushroom or a jellyfish. on the side, it reads

7234 ITS 30074

i first thought it could be an fet (tis 74) but the designation doesn't quite match. the manufacturer's logo looks like harris but it's so small and smeared out. any ideas?

722. Need QSL help for some old QSO's

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-12 01:03:19 UTC
From: rab@hal.cwru.edu
Message-ID: <1qaf4n$jsj@usenet.INS.CWRU.Edu>
Source record: 283548

Can anyone help with QSL information for a few QSO's I made a while back?
Please e-mail me (rab@hal.cwru.edu) if you can help.

4K4/UA9MCM This was CW on 15m on 2 NOV 91. I QSL'ed direct to
UA9MCM's CBA and haven't heard a peep.

ZK2RW This was CW on 10m on 28 NOV 91. I QSL'ed through the
bureau originally and later direct to the CBA. Nothing.

8R1J This was CW on 15m on 11 JAN 92. No reply to my direct QSL
to the CBA.

3D2UU This was CW on 10m on 3 FEB 92. I QSL'ed to DF2UU and have
gotten nothing back.

ZS70SAN/ZS1ACJ This was CW on 10m on 6 APR 92. No reply to my QSL to the
ZS bureau.

I enclosed a self-addressed envelope and either a greenstamp or IRC's with
all direct QSL's. If anyone can offer suggestions (e.g. QSL managers),
I'd appreciate the help!

From: mrapple@quack.kfu.com
Message-ID: <f1OgSuk@quack.kfu.com>
Source record: 283551

I just saw the add for the TS-50S on the back cover of 73.
Looks very, very nice. I'd like to get more specifics on
features. Quite frankly, I'd like to know what the difference
between it and, say, a TS-440. I was thinking a 440 would be
my next rig, but this one looks like it might be a good
bet.

What's the receive range? Can it be modified for out of band
transmission (if one had, for example, a transverter or
was in MARS)?

One bit of inconsistency is that I don't see any control in
the picture for changing transmitter power output.

726. NASA SELECT rebroadcast frequencies

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-12 02:45:56 UTC
From: jtg0707@uxa.cso.uiuc.edu
Message-ID: <C5CnoL.DHJ@news.cso.uiuc.edu>
Source record: 283552

Hello all. I need to ask all a favor!

I am trying to compile a listing of NASA SELECT rebroadcast frequencies
for various cities and town throughout U.S. I've decided to do this after
failing to locate anything similar on the net.

If you will be so kind as to send me the frequencies in your hometowns, I'll
try to compile a list and post it to the net as soon as I get enough responses.

If you decide to respond, I will be much oblieged if you can put it in the
following forms:

Town/city, state 2m freq 70cm freq email address

This will help me as far as cut and paste goes.

If you decide to remain anonymous, just leave the email address out.

Thanks in advance.
J.T.
jtg0707@uxa.cso.uiuc.edu

P.S. Please keep the email as short as possible; my mailbox isn't very big.

>
>How easy/hard is it to convert a cb radio to 10m or any other amateur bands?
> (deleted)....

It depends on which radio you have, and primarily which PLL IC it uses to generate the signal. Many older design PLL's have a straight binary or BDC input from the channel selector switch to generate the desired frequency. On these type of radios, it is a matter of changing the input from the channel selector to change frequency, followed by some minor tuning of the radio to get 10 meters. Good PLL IC's are the uPD858, MB8719 or PLL02A in SSB radios. Other CB's can be converted by changing crystals in the loop mixer, or adding external oscillators. Many newer radios are practically unmodifiable. Older styles of SSB with 40 channels are your best bet for 10m conversions. The Cobra 148/2000 GLT's are prime for this. Most conversions are limited to about 1-1.5 mhz range, also. FM is also possible - I don't know about CW, but I'm sure it's been done, too.

There are several books out on CB mods, and there's some good how-to stuff in these. E-mail me if you have a specific question. I might add the standard disclaimer that these mods are for hams only on ham frequencies only!!!

Cross-posted to: news.groups,,rec.radio.amateur.misc

All right, you guys. You've convinced me that splitting the newsgroups will not result in an avalanche of cross postings. I am, therefore, going to support a split.

I do have some reservations, however, about some of the proposed groups, and the lack of others.

Overall, I prefer the Option 1 split to Option 2, as it allows the newsgroups to be more directed or focused. I don't like, for example, the proposed mix of technical discussions and examinations in r.r.a.tech in Option 2.

I'm more ambivalent about the need for both proposed digital groups. I'm not sure, for example, what is so special about tcp-ip that it can't be discussed under rec.radio.amateur.digital. Is there really enough traffic for this group to warrant a group of its own? I'm not opposed to r.r.a.tcp-ip if there is, but I haven't noticed a need for it in r.r.a.packet. Could someone elaborate on the rationale for this, and perhaps guesstimate traffic volume? Oh, and BTW, shouldn't CW get r.r.a.digital.cw for itself? :-)

In addition, what was the reason for placing NTS under emerg-services rather then operating? It seems to me to have elements of both, but to be rather more in the operating camp.

I do feel that we should have included a major topic like antennas, though, with its own group. I propose, therefore, that we add r.r.a.antennas. Its area of discussion would include any antenna topic - designing, building, performance, etc.

Lastly, I'd like to change the proposed name of r.r.a.construction to r.r.a.tech, and to broaden the concept slightly to include technical discussions of all kinds, including construction. If there are those of you who feel we absolutely MUST have a separate group for building, I'd still like a group for other technical discussions.

I had a similar thing happen to me several years back, while I was still
in school at Texas A&M (we were in the absolute pits of the cycle at the
time....basically, on a good day, there might be one sunspot). I was up
at the shack (W5AC --- TAMU ARC club station) between classes, as usual,
umm, studying <grin>. anyways, this particular day, I was, umm, studying
in the voice portions of the bands, and decided (one of those ``what the
hell'' type decisions) to check out 15m, since 20m was way over-crowded
(what's new?).

sure enough, 15m was dead silent. nothing. oh, wait, here's one....
5H3GB, what the hell is that? anyways, while I kept trying to figure out
where this guy was from the big map on the wall, he kept calling CQ and got
nothing, so I gave him a call. to this day, this remains my absolute
favorite/most memorable QSO (and there have been quite a few that fit into
that category!). we chatted for a little over an hour, barefoot and 5x9
plus the whole time, until right at the very end, where I had to kick in
the afterburners for my final transmission only (to say 73).

and, of course, since 15m was ``dead'', nobody touched us for the entire
contact.

>I believe that the lawsuit the national LARC filed against the ARRL was
>based on Connecticut anti-discrimination laws. If that's true (and someone
>can correct me if I'm not - I've heard all this stuff second-hand at best),
>then maybe some civil rights, or at least legal rights, were violated.

Can you confirm that there is indeed a lawsuit? If so, then as somebody
else pointed out, the existence of the lawsuit would explain why the ARRL
has never issued any comments on the matter and why the ad has never
appeared (the ARRL obviously wants to assert its right to refuse an ad,
regardless of the merits of this particular one).

I gotta start paying closer attention. I missed this.

While NTS comes into its own during an emergency, it is more than an emergency service. The daily NTS nets are for training operators for traffic handling during emergencies. Stress on the words "daily" and "training".

First, I don't think that there is many posts concerning NTS. Second, NTS is mostly made up of experienced traffic handlers. My concern is that those who might find NTS great fun might not find it under emerg-services. NTS is more than ARES/RACES, but certainly a part of those services.

John:

As you stated, the letter of the law is exactly correct. But the original post was much more bothersome. If I understood it correctly, the cable company understands the law but is trying to use local, neighborhood, propoganda to force the ham station off that frequency.

Also, the original posting mentioned that the FCC had been contacted but did not say what happened.

The original poster asked for reponses via email rather than netnews. I, for one, would be very interested in reading the responses and also learning what the final disposition of the case is when it happens.

This is a thread that is ripe for a switch to rec.radio.amateur.policy. I hope to see more of it there.

<some lines deleted>

>Randy, VE3WRN

Randy:

I no nothing about the MFJ989C tuner but perhaps you would like to hear my experience with the MFJ-945C. When I originally hooked it up I noticed that when I jiggled it the received signal changed (I was using a new rig and thought maybe the rig was to blame!).

After examining the UHF connectors on the back, I noticed that they wiggled a little when pushed. They were connected to the chassis of the tuner with aluminum pop rivets that were not holding the connectors on very tightly and did not provide a good ground connection from connector to chassis.

I drilled out the rivets and replaced them with screws, nuts, and lots of lockwashers. That solved the problem and the tuner works fine for me. However, I was a little shocked that MFJ would make something that poorly.

Good luck with your tuner purchase.

No, on HF almost any decent antenna switch has negligible loss.
People have even made usable switches at the 100 watt level out of
AC wall switches. What may be a problem is the *isolation* of the
switch. A cheap switch may have only 25 or 30 dB of isolation, which
means that running a kilowatt to the antenna through the switch may
result in over a watt being sent to something else hooked up to the
switch. A watt is enough to damage many receivers :-(.

But, as you get up into the microwave bands, switching loss *can* be
a problem. At 10 GHz, I'm still looking for an SMA connectored relay
with under 0.2 dB of loss. Typical loss is 0.5 dB. But, even at
450 MHz good relays often have under 0.1 dB of loss, which is suitable
even for EME work. I said relays because, as a practical matter, high
quality relays are often easier to find on the surplus market than
switches.

>: markz@ssc.com (Mark Zenier) writes:
>: We're not voting right now - we're in the discussion period.
>I know that. Quit acting like a twit.

My remark was not intended to make any negative comment for you. It was more intended for the net.lurkers who may be dropping in at this point. I've learned that I have to repeat that we're not voting yet - otherwise someone will drop in at the wrong moment and try to cast a vote.

>: If you support any, please vote for all of them. They were all carefully
>: chosen because they are topics expected to succeed once they are in use.

>But you seem to be operating under the impression that the two
>proposals you came up with in private discussion are carved in
>stone. This IS the discussion. The proposals are not good.

Agreed - this IS the discussion and the proposals are not cast in stone. I'm trying my best to tally all the inputs. So far, one change has had enough support to change the proposal: r.r.a.space will definitely be included on the CFV regardless of the Option-I-or-II issue. I'm watching all threads and taking notes - everything else seems to have had enough opposition to make a change unlikely so far. I emphasize - SO FAR. We're not done. Things can change if enough people want them.

To prove that I'm watching carefully, Mark, you suggested the following:
* "Products should be named .equipment," and later, "I HATE products (as a name)."
* "And I would be interested in a .construction or .homebrew group. Expecially if kept seperate from .products/.equipment."
* Referring to r.r.a.operating, r.r.a.products, r.r.a.instruction, r.r.a.construction, you said, "these names make the same mistake as .policy by being over generalized," and suggested to make them r.r.a.dxing, r.r.a.equipment, r.r.a.beginner, and r.r.a.homebrew.

The only responses were from Paul Schleck and Robert Smits. Paul said that the rra-reorg group started with those same names but evolved it to the RFD that was posted. Robert agreed with r.r.a.dxing and r.r.a.homebrew. In a somewhat-related topic, Bob Snyder wanted to combine r.r.a.products and r.r.a.construction into r.r.a.equipment - you opposed combining the product-type equipment with homebuilt equipment.

From my position of trying to determine where the discussion is steering things, that light response doesn't exceed the threshold of interest to

make a change. (R.r.a.space got its position by support far exceeding opposition.)

Now, I'm not personally against the names you've mentioned. In fact, you've come very close to the original proposal *I* made when we created the rra-reorg mail list. I suggested, based entirely on an analysis of the threads in r.r.a.misc, that we use r.r.a.dx, r.r.a.equipment, r.r.a.antenna, r.r.a.instruction, r.r.a.homebrew, r.r.a.satellite, r.r.a.repeaters, r.r.a.emerg-services, and r.r.a.announce. Add to that r.r.a.video, r.r.a.space, and others were suggested by Mark VE6MGS.

It didn't take long before we decided that was WAY TOO MANY newsgroups and put some on the chopping block, bringing 13 new newsgroups down to 7:
* r.r.a.dx and r.r.a.repeaters combined to become r.r.a.operating.
* r.r.a.equipment needed to be more differentiated from r.r.a.homebrew so it became r.r.a.products. It absorbed part of r.r.a.antennas.
* To clarify the name for Hams and non-Hams, r.r.a.homebrew became r.r.a.construction. It absorbed the rest of r.r.a.antennas.
* r.r.a.announce was overlap with rec.radio.info so it was deleted.
* r.r.a.video would not have enough traffic to sustain its own newsgroup so it was deleted.
* Mark's name r.r.a.space won more support over my r.r.a.satellites. (Even I thought space was a better name. :-)

It was rather late in the game that Steve KB0AGD, with support from Steve KD6GGD, proposed the r.r.a.digital subhierarchy. Everyone seriously into packet seemed to agree that it was a good idea so the rest of us went along. That was where the proposal gelled into what we thought could make a reasonable RFD.

>You have to show some flexibility in modifying the proposals or
>I'll oppose this just because of the way the discussion was run.

If it were only necessary to convince me, your changes might have been added already. But I've been looking for indications that you have convinced others. I'm being really honest here - I'm keeping records and I haven't seen it yet. If significantly more people show support than opposition for changing r.r.a.products to r.r.a.equipment, it will happen.

What's "significant?" That's a tough call sometimes but 2 people (including yourself) in favor vs. 1 person opposed to r.r.a.equipment isn't enough to make a change. r.r.a.space got in easily with 4 vs. 0. The numbers for r.r.a.dx(ing) are 3 in favor vs. 3 opposed so far. I have not added my own opinion into any of the numbers listed in this paragraph.

I hope I have, to some extent, convinced you that I'm sincerely trying to moderate all the inputs fairly. I have realized since the beginning of the whole process that, if we are to make a successful proposal, there will be many things that are not my choice but the choice(s) of others. In fact, the reason why I took on this effort was because it looked quite obvious someone was going to do it soon anyway - I wanted to make sure the process would be open to the input of others. (More details on that can be found in the

rra-reorg mail list transcripts around line 1360. I had a bad experience to use as a counterexample. The transcript can be FTP'd from charon.amdahl.com in /pub/radio/amateur/rra-reorg.log.1.Z, just in case the last mention of it expired from anyone's news spool already.)

>proposed mix of technical discussions and examinations in r.r.a.tech in
>Option 2.

Well, in my tally you just broke the tie! I wish more people would express
their opinion on this one...

Of course, I'm normally looking for a lead of more than 5 to 4. Since these
two options mix about as well as oil and water, we're going to have to just
pick one pretty soon. I share your concern about the over-generality of
the r.r.a.tech option, but this is the one issue where I saw enough of a
problem to throw my voice into the tally... so I'm already one of the 5.

From what I can tell looking through what has been posted, most people in
favor of the split will accept either option just as long as the split
succeeds.

The process often takes up to 24 hours for myself to recieve a reply from the server. Only thing I can figure is its probably some lag time due to high usage of the internet. I dont feel its the ARRL end because once I recived a reply for about 3 different files in only 6 to 7 minutes. Guess the best advice is to just be patient.

741. QRP mailing list announcment

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-12 12:42:21 UTC
From: bruce@think.com
Message-ID: <9304121242.AA21723@mickey.think.com>
Source record: 283565

This is an announcement of a new QRP Internet mailing list.

The QRP mailing list is open to all topics relating to low-power amateur radio operation. Example topics: portable operation, equipment design and construction, solar and battery power, QRPp, contesting, ...

The mailing list address is QRP@Think.COM; mail to that address will be sent to everyone on the list without human intervention. There is also an administrative address QRP-Request@Think.COM which will be monitored by the list maintainer(s); please use that for such requests as adding or removing yourself from the list, questions about the FTP access, etc.

This list was started by Chuck Adams (adams@chuck.dallas.sgi.com) by an announcment on the rec.radio.amateur.misc USENET group. I agreed to help out by maintaining the list and an FTP area.

> amateur spec for tones, but the rule of thumb is around 3 kHz deviation.
>
I agree with this but it should also mention what digit to press when setting the deviation. Because of transmitter pre-emphasis, a DTMF signal using higher frequency tones may clip if the deviation has been set to 3 KHz on a low frequency dtmf signal. For that reason, I always set DTMF deviation using the "#" key which is the highest frequency tone pair that can be sent using a 12 key keypad.

There has been much banter and flamage about the proposal to solve personal problems with yet another reorganisation of the wrecked.radio.by.amateurs groupings. So I want to propose yet another damn group.

I know it will be well subscribed and possibly well cross posted. I humbly offer to the community:

rec.radio.amateur.reorganisation

It should be unmoderated, but we will let people take turns pretending they are the moderator.

It probably *is* our end for the most part. We're operating our Internet
connection on a shoestring at the moment, and its reliability leaves
quite a bit to be desired. It'll improve, but for the near term I can't
promise you responses in the sub-hour range all the time. Sometimes it
will take 24 hours, occasionally it may take longer. But rest assured
that we *do* respond if we possibly can, and we are working on improving
the response. It just takes time to make these changes.

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DF4RD, W2JGR, K2MM, WB3LHD, K4CEF & Southeastern Cluster Group, WF5T, K6OZL, KQ8M, N9HZQ and N9LJX for the following DX information.

4N5, MACEDONIA. This country is still under study by the ARRL Awards Committee for possible DXCC country status, but this may change. This week Macedonia was approved for U.N. admission by the Security Council after months of haggling with Greece over the symbolism of former Yugoslav republic's name and flag. Under a compromise worked out with Greece, the new country was admitted with the cumbersome provisional name "The Former Yugoslav Republic of Macedonia." Negotiators will choose a new name later. (from the Associated Press)

5A, LIBYA (and 3V, TUNISIA). Information from Murphy, W4WMQ, and Verne, W8BLA, indicate that Romeo, 3W3RR, was reportedly in the hospital with pneumonia, but there are reports now stating he is out. The reported status of these operations is that the equipment for both 5A and 3V are still in Sofia. At this time there are insufficient funds for the operations and the DXpeditions will be postponed until May. Also, there has been some "coordination difficulties" with 5A officials. It was also reported that Romeo may make it to Dayton Hamvention depending on his health.

5X, UGANDA. Paul, WF5T, supplied OPDX with more information on his upcoming DXpedition to 5X-land. Paul mentions not only is James, N3JCL, accompaning him, but Jim, KF7E, has been added to the trip. Jim is awaiting his own assigned call sign and plans to do his own QSLing. Tentatively, they plan to start operations from the Queen Elizabeth National Park in the Southwestern part of Uganda. Do to travel time, they may not be on the air until April 28.

9G, GHANA. The 9G1AA operators have stated that they will be shutting down their station at 0000z, April 12th. The operators were invited to return to Ghana and have stated they would return in November. They have a permanent license. It was also reported that the operators did not operate any RTTY because the equipment was damaged in transit and

was unrepairable. They tried to arrange for replacement gear, but were unsuccessful. Jules, W2JGR, was told by one of the operators that "RTTY is completely out of the question for this trip, but will be definitely in the next trip".

BY, CHINA. Dieter, DJ7BU, has been active on 30 meters using the university club station BY1QH. He usually can be found on Saturdays around 1000z. When working Dieter, QSL via to his CBA.

ET, ETHIOPIA. There has been plenty of activity from this one by ET3DX, ET3TI, ET3YU and ET3SID. Most of the activity seems to be on 15 and 20 meters. QSL ET3DX to JH1AJT, ET3TI to OH5MVT, ET3YU to YU1FW and ET3SID to Syd T. May, POB 60222, UNECA ADDIS ABEBA, Ethiopia.

HB0, LIECHTENSTEIN. The 17th Annual DXpedition to Liechtenstein by the Wiesbaden Amateur Radio Club (DA1WA) will take place May 28th thru June 6th (There will be some individual activity after June 6th.). HB0/DA1WA will operate on CW, SSB, PR, RTTY, AMTOR, PACTOR and Satellite. Activity will be on 160 thru 10 meters as well as 2 and 6 meters. North American QSLs go to KN6G at Box 4205, APO AE 09192. QSLs outside of N.A. go to DJ0LC.
Wulf, DL2GWL, and Andy, DL8GCL, will also be active from here for 4 days, May 13-16. Callsigns HB0/DL2GWL and HB0/DL8GCL will be used on the HF bands. QSL direct with one IRC to: DL8GCL, A. Lenk, Am Eichwald 15, D-7898 Lauchringen or DL2GCL, W. Lang, Bundesstrasse 12, D-7898 Lauchringen.

JT, MONGOLIA. Jeff, N9HZQ, received a letter from John, N9JXU, stating the following: Dave, JT1/KB9IBZ, who is a missionary in Ulaan Baator, meets with his QSL Manager John, N9JXU, every Friday at 0100z on 14220 kHz. Anyone who needs JT is invited to stop by. John also mentioned that Dave and the MRSF club radio station is in need of some tubes. If you have any of the following tubes, PLEASE contact John, N9JXU: 2 - 12BY7A, 2 - S2001 (6146B), 2 - 6EJ7, 2 - 6JSC6 and 4 - 811A.

V4, ST. KITTS. Joe, WB8GEX, and John, WZ8D, will be active April 10th thru the 17th. Callsigns will be V47NF and V47WZ. Activity will be on all bands and they plan to operate on the low end of the General's portions of the band (if needed, they will listen up 4 to 5 kHz). Look for them on 28494 kHz +/- QRM. For 160 meters, check 1834 kHz at 0200z. QSL's for V47NF go to WB8GEW (not WB8GEX) and for V47WZ, they go to WZ8D.

VK9Z, MELLISH REEF. Guy Collin, ON4ACG, is soliciting for more operators for the mid to late September DXpedition to Mellish Reef. If interested, contact Guy for more details. His phone number is 016.44.55.59 and his FAX number is 016.44.33.62.

XT, BURKINA FASO. Peter, XT2BW, has been quite active on RTTY on or around 14086 kHz at 0630z. Peter mentioned that he likes to show up from time to time on RTTY before he leaves for work in the mornings. QSL via WB2YQH.

ZA1A CARDS. Martti Laine, OH2BH, has mentioned this weekend that OH2BGH will be bringing ZA1A QSL cards with him to be mailed in the USA. These are the cards that came with non-standard European sized envelopes. As mentioned in last week's bulletin, sending non-standard European sized envelopes in Finland requires more than $1 U.S. postage.

DXAC NEWS. The result DXAC vote on Czechoslovkia was released this week and the DXAC voted 16-0 to delete Czechoslovakia and to add the Czech and Slovak Republics as new DXCC countries. This recommendation will now be sent to the ARRL Awards Committee for action.
The DXAC also voted against a change in Rule 10. The voted was 14 to 1 not to change DXCC Rule 10 to allow contacts made from a club station to apply to an individual's DXCC award. Committee members saw no compelling reason to change the existing rule.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3 FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

748. Re: Announcement - ARRL Information Mail Server (info@arrl.org)

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-12 14:31:20 UTC
From: ehare@arrl.org
Message-ID: <1362@arrl.org>
Source record: 283331

I am sorry to hear that a few folks have had some problems with the
use of our server. I do get email from time to time from folks who
are reporting non-delivery. In most cases, there was a delay somewhere
along the way and the requested files arrive at their destination
before my explanation.

Email on the internet is a strange beast, indeed. The message to
info@arrl.org, or its reply, can be delayed at any of several
points along the way. Delivery is not guaranteed. We have seen
delays in our internal mail gateway machine, or my machine (the
'386 that keeps all of our files and the server software). In fact,
if I want to run WordPerfect, I turn off the server just to speed
things up. :-). There have been a few occasions of three-day delays
if things got hung up at the wrong time. Most of the time we try
to turn things around much quicker.

I will also point out that we have seen some real strange things
in the incoming mail. I get failed mail with invalid hosts
(user@localaddress), invalid users at good hosts, and a host (groan)
of other failed mail messages. I also get blank messages, English
messages to our automated server, and people who just plain make
commands up hoping they would work. Early on, we added an alias file
so that the SEND command will also recognize GET, SEND FILE, etc.
INDEX is aliased to LIST, INFO and FILES, just to accomodate the
users who either have not seen the HELP file, or who have not
actually read it. :-).

If anyone has had a problem with the server, please ascertain that your
From: or Reply-to: address are valid internet addresses. We have just
added a REPLY command, so you can always tack your valid internet address
there. If all else fails, send me an email -- I will see how I can
help. (Please include your Internet address in the text of the message
so I can compare it with your header information.)

>>>many articles were ONLY posted to policy. Find any?
>>Yes.
>Big deal. How many? What percentage do they form of the overall postings?
>I'll bet you it's less than 20%.

What is the point, many of us (on both sides of the camp) agreed that
r.r.a.policy was a poor attempt to create a dumping ground for
unwanted debates. We all learned our lesson that creating dumping
grounds will not work. Please look at the success of r.r.a.packet as
that group is more in line with the principals of the splits that are
recommended.

What emd is *realy* complaining about here is the fact he runs a
DOS BBS package that has serious problems with cross-postings, not with
r.r.a.policy specifically. He has fears that cross-posting will
increase (and this increase his problems). What realy needs to happen
here is for some pressure to be placed on the authors of WAFFLE and
the like to add in some of the capabilities of the popular news readers,
since Waffle is typically used as an off line news reader anyways ...

If I had a Waffle site downstream of me, and if it were a leaf site, I'd
have no problems providing the filtering services, but this can be done
on your site too Robert (replace rnews with a simple BASIC program that
filters the articles, `adjusting' the Newsgroups filed if necessary, then
calling the *real* rnews). The process is a simple text filter and should
be capable of providing your own Universe. If you are not capable of doing
this on your own, send me email and I will investigate and help you with
this problem (I have made this offer twice in previous postings, and in one
private email to you Robert).

Ciao -- Mark

From: popovich@cs.columbia.edu
Message-ID: <POPOVICH.93Apr12100727@prince.cs.columbia.edu>
Source record: 283566

One time, when it had taken a day or so to get a reply from the info server (something that usually takes a few minutes to a few hours for me), I asked what the problem was. The following is an excerpt from a message that I got from Ed Hare at ARRL HQ.

>BTW - the server is sometimes down for hours at a time if our
>gateway crashes -- it often needs to be manually restarted. Our
>net software is homebrew and still has a few bugs.

So it just seems like they have a little problem with flaky software. Any net.hackers near Newington feel like lending them a hand? :-)

I don't see why this should be illegal. It's just like the local ATVers here in Huntsville, AL have a remote camera mounted on Montesano mountain overlooking the city that is remotely controlled. In your case, the driver of the car is not the control operator. He's not operating the transmitter; he's driving the car.

Have fun! After all, thats part of what Amateur radio is all about....

paulf@abercrombie.Stanford.EDU (Paul Flaherty) writes:

>This is the correct interpretation. The implication is that the .misc group
>is not needed, as it thus only serves as a large soap box for flame baiting.

Beware, sounds like we are creating a new newsgroup called r.r.a.misc to
be used as a dumping ground for flame wars! :-)

>I still think that we may be better off if we can find a way to improve
>posting quality. Perhaps with a little peer pressure, and some posting
>guidelines, we might be able to achieve better results.

This sounds like we should start using our self policing native to Amateur
Radio. If the current FAQs associated with the news group(s) are not doing
the job, we may need more (and smaller) FAQs, posting quidelines and
welcome articles. I think this is in the works in the rra-reorg mail
list as we speak, so rest assured this is being addressed.

Peer pressure requires some commited individuals to periodically send
private email guiding the poster when he strays. I think we do have a
couple of people that do this, perhaps some co-ordination is in order ...

Ciao -- Mark

757. N0DH address no good?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-12 15:35:34 UTC
From: ham@wam.umd.edu
Message-ID: <1993Apr12.153534.26255@wam.umd.edu>

I regularly have QSOs with V31FX on 10m when the band is "dead". We
(W5YM) have a TS430S and a HyGain tribander, she has an IC725 and a
trap dipole.

Of course, yesterday either V3 was in the skip zone or 10m was *really*
dead. Nada.

The Icom W21 (a dual-band HT) continues to receive on the other frequency while you transmit on the main frequency. Is there any way to turn this off? The problem I'm having is that the received audio gets transmitted back out with my voice. I know I can set it to single-band operation, or just turn down the volume on the other band, but I'd rather not do this.

Does anyone have a complete list of W21 undocumented features, mods, etc.

- Derek

There are a couple of repeaters on St. THomas, a couple on St.Croix, and even one on Tortola that are reachable by HT..... There used to be a lunch every Wednesday just west of Christiansted, at a place called the Quarter-deck, with a lot of the USVI (and a few of the BVI) hams showing up for good eats and Adult Bevvies. I don't know if the location has moved, but I think the weekly lunch is still going on.......

I forget the freqs of the island repeaters, but they're pretty common.

Enjoy!

I've just recently worked both coasts from the novice portion of the 10 meter bands. Also have worked Haweii, argentina, caymen islands, spain, portegul, and several other central and south america countries. Not to bad for all SSB work.

(gotta get my code back up to snuff!)

763. Trapped Dipoles Yea or Nea?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-12 16:54:26 UTC
From: jeffj@cbnewsm.cb.att.com
Message-ID: <1993Apr12.165426.14035@cbnewsm.cb.att.com>
Source record: 283333

I am currently using a shortened G5RV that works great on 20 and 40
meters but isn't, to say the least, all that great on 10 and 15 meters.
I have a book on wire antenna's that shows how to build a trapped
dipole that is resonant on 10 through 40 meters and as I work a lot
of 15 meter DX this looks like a better antenna for my uses. What are
the benefits and drawbacks of a trapped dipole? I realize there is some
loss in the traps but as I am running around 400 watts on SSB I
can stand to lose some power. Thanks for any help here! 73!

To quote a sneaker advertising slogan: Just do it.

I assume that the driver doesn't have any control over it. Therefore,
you are in control.

It's a neat idea. Just do it.

Hi All,
Anyone know what's on 145.510 in New Jersey? I was looking for shuttle rebroadcast activity yesterday and came across data on that freq. It wasn't one way, either. I distinctly heard three or four different stations communicating with each other (based on transmission strength) just squawking data repeatedly. Is that packet radio or something? It was so continuous, that I didn't think it was RTTY or a human keying data.. it sounded like a stream.

Just wondering!

Steve

Date: 9 Apr 93 13:52:52 GMT
michael@vk2bea.UUCP (Michael G. Katzmann) replied to article
<1993Apr2.144727.29661@tellab5.tellabs.com> jwa@tellabs.com (John W. Albert)
>
> A NEW DSP FOR PACKET

>Pre-filtering
>
>The first function is a sixth order Chebyshev bandpass filter. The
>filter reduces noise and improves the performance of the A.G.C.

Chebyshev filter??? This will really mess up the data! You want to
maintain the integrity of the data, but the poor group delay response
of this filter will create alot of intersymbol interference. Surely
a Bessel, FIR or other linear phase filter is what should be used.
(or have I miss-understood the use of this device??)

Heres my reply

We selected the the Chebyshev filter because it has the best rejection
in the stopband. Because the modem was designed for the crouded H.F.
packet frequencies, we needed the best filter that provided out of band
rejection. It's true that the filter has poor group delay but we found
(using computer simulation) that different filter types performed about
the same. Another filter may have better group but you sacrafice the
stopband rejection.

Chebyshev filter are some what linear within the bandpass, however, the
group delay is non-linear at the band edges. We simply normalized it to
obtain the best of two worlds.

Not mentioned in the article was (it appeared in the Oct 92 issue of QEX)
a new filter called the "Bowtie" which is used in the channel filters
(Discriminator circuit). The Bowtie uses two two pole bandpass filters
(usually state variable types) In the mark and space channel to provide
maximum seperation and linear phase. An article will appear in future
issue of QEX.

I built one following the design described in May 78 QST, and had
no trouble getting it to work. It's done fine every time I've used
it in the past 15 years... I do wonder where you easily get
appropriate PIN diodes now; I don't think the Motorola ones
used in that article are available now. A doppler scanning antenna
(as described in that article) is IMHO much easier to use than
the "double duckie" type.

From: ron@topaz.bds.com
Message-ID: <1qc9okINN2l7@topaz.bds.com>
Source record: 283362

NASA SELECT is not the proper term here. NASA SELECT is the video feed.
Goddard (and probably some of the other retransmission sites at NASA installations) get their audio through a different network. If you
bring up WA3NAN audio while you're watching NASA SELECT, you'll notice
quite a delay in the NASA SELECT audio.

>
> Any other comments for or against would be appreciated.
>
Well -- I have had a R7 mounted on a mast attached to the roof (up abt 35')
for about a year now. It works fine and has been through 60 mph winds. It
does bend a lot and is scary to watch, but always comes back to vertical when
the wind dies. Performance seemed better than when it was mounted lower to
the ground. Hope this helps...

772. STS-56 Contact with Parkway Middle School

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-12 18:09:06 UTC
From: garym@telesoft.com
Message-ID: <1993Apr12.180906.1849@telesoft.com>
Source record: 283341

This morning I was over at Parkway Middle School in El Cajon, CA where they had a scheduled contact with the Shuttle. Everything went great! Ellen Ochoa, KB5TZZ, on board Discovery answered after a couple calls from Kerry Banke, N6IZW, about 1 minute after the predicted AOS time. Ellen's brother, Monte, was on hand and exchanged greetings with Ellen and then turned over the mike to the first student. The shuttle was coming thru loud and clear, with both the questions and the answers coming over the PA system in the auditorium. We were fortunate to have a good orbiter attitude with the SAREX antenna pointed in our direction and all the equipment worked fine.

Eleven students took turns, each asking a question and Ellen clearly heard and answered each one. Several students helped with the setup and operation of the SAREX ground station, two students operated the elevation and azimuth controls to keep the antenna pointed at the shuttle during the pass. It was a real thrill for about 150-200 people in the auditorium, mostly students, with parents, teachers, and news media also on hand.

Two of the local TV stations sent out camera crews and videotaped the event for the local news. We'll have to watch the news tonight and see what kind of coverage we get. The students also use the school A/V equipment to make there own videotape of the event, and recorded the audio from the uplink/downlink as well.

NTE and ECG carry cross-replacement parts and are supported by many local electronics stores like Circuit Specialists in Mesa, AZ.

The NTE cross-replacement parts are BC107=NTE 123A, and BC141-10=NTE 128

The ECG cross-replacement parts are ECG 123A and ECG 128.

Please post your Internet address next time...thanks, KG7BK

All operation and service manuals are available from Tandy. Just walk into any local Radio Shack store and ask to order them. Just make sure that the person behind the counter fully understands what you want AND writes it down correctly. I have ordered service manuals for all of the Radio Shack goodies I have purchased over the years.

Ours made it through very high winds recently (trees were blowing down around it). It's pretty floppy (you can see that just by shaking it) but it seems to ride out the storms pretty well. There are at least four others in the neighborhood that went without problems as well.

Source record: 283342

>Thats what everyone says -- what they mean is 10m F2 is becoming less
>frequent as the flux declines.
>
>But keep in mind:
>
>1. The solar flux becomes very variable from day to day around the
>minimum. It can suck bad for several days then open up. The problem
>there is there are few people looking for the openings! Listen to the
>beacons and call CQ!

The flux actually gets very stable in the sunspot minimum. It will go for
months and months in the range of 69 to 71.

>2. Sproadic E will always be around during the summer. Just wait for
>the right times (and hope there are other 10m enthusiasts out there!).

Yes E skip is good during the summer as well as December regardless of
the solar flux. Makes for good US contacts. I got 10 meter WAS during
the sunspot minimum before last.

>3. try CW (or a digital mode). Often you can find nothing on SSB but
>there is interesting stuff at the low end of the band.

The Novice bands are the place to listen. Lots of local contacts going on
in the the Novice SSB segment. You hear these contacts as the band opens up.

>4. go for north-south paths. Forget about over the pole!

Yep.

>5. There is always the mode A (or mode K) Russian satellites if the
>band is dead!

If you have a gain antenna, and a bit of power, backscatter contacts can be
had on 10 meters during the minimum. Point your antenna southeast in the
morning, south during midday, and southwest in the afternoon. You can work
other US and Canada stations also beaming that direction looking for
backscatter.

: Well I don't know if I'd call it dead. Perhaps it's expiring? But I
: tried to work 9G1AA and FO4OK today on 10 SSB, and heard a ZL2 and saw
: spots for V73C and a few others. Not bad pickins for a dead band.

When the flux gets down to the 70 range most 10 meter DX contacts will be
with South and Central America. From here (Colorado) we will still work the
occasional African (the farther south he is the better) and we get frequent
short VK/ZL openings.

I operated the ARRL DX contest from St. Kitts (V4) during the last minimum.
10 meters was open to the US about three hours the whole contest weekend.

Someone here suggested marking direct mail to Mongolia "via Japan" after the Mongolian address. I just wanted to report that it worked for me - 3 cards out to different JTs, 3 cards back direct in quite a short time. JT cards have always been hit and miss for me - some come via the bureau, most direct ones were not answered. Anyway, if you need one, try this route - and thanks to whomever suggested it. (The default route takes the mail through Russia (ex-USSR), where the $s and IRCs tend to evaporate. Marking it via JA avoids this part of the trip).

The 10 meter FM repeater 29.66 has been loud and clear in North Carolina
for a couple of weeks when 10 is open. Stations in Mexico City, Boston,
Detroit, Tucson and Canada.

Is there a local (US Virgin Islands) two meter crosslink to this so
that someone with a handheld could talk over North America?

Message-ID: <1993Apr12.193637.18340@cbnewsm.cb.att.com>
Source record: 283348

the other day I made my first attempt at gray line dxing from here
in the San Francisco bay area. I worked a Taiwan ham on 40 meters
at around 0100UTC (6:00am) for my only second DX contact on 40 meters.
I heard a fair amount of strong signals and about 15 minutes later
they all more or less dropped out. Now according to a gray line program
that I have Taiwan is not on the gray line. He was 559 to me and I was
the same to him. How exactly does Gray Line dxing work? Does the other
DX stations have to be almost exactly on the gray line to have it
work or in the general ballpark? From what I can tell Gray Line should
work whether the station is at it's sunset/rise times. Thanks for
any help here! 73!

I would say European size envelopes are the ones called DIN C4.
They are 163mm x 114mm, or 6.4" x 4.5".

Well, since you ask... :-)

>OK... friendly counteropinion time... I support Option I. (Can anyone guess
>whose input contributed to which parts of the RFD?) The reason is because
>Ham Radio is almost entirely a technical subject.

I agree with your conclusion, if not completely with your reasoning.
I notice no one has suggested folding .operating into .tech, so I
guess there are *some* nontechnical components of ham radio!

A better way to put it, I think, is that most parts of ham radio have
some technical *component*. (That may be what you meant.) That being
the case, having a .tech group and a .misc group will lead to much
confusion as to where to post. Which will lead to a greater level of
crossposting with the associated problems for some users.

>The r.r.a.tech group seems
>(to me anyway) to blur too much with r.r.a.misc due to the breadth of its
>coverage. I think that breadth will cause confusion as when users try to
>pick r.r.a.tech or r.r.a.misc to post in...

It blurs not only with the r.r.a.misc group, but with other groups
as well.

>For reference, here is Option I (subject to change by this discussion):
> rec.radio.amateur.misc (existing)
> rec.radio.amateur.policy (existing)
> rec.radio.amateur.digital.misc (existing as r.r.a.packet)
> rec.radio.amateur.digital.tcp-ip
> rec.radio.amateur.operating
> rec.radio.amateur.products
> rec.radio.amateur.instruction
> rec.radio.amateur.construction
> rec.radio.amateur.space
> rec.radio.amateur.emerg-services

In general, I think this option (option I) is the way to go. I do have a couple of specific suggestions I'd like to toss into the discussion.

r.r.a.instruction: I'd like to see this broadened to include all kinds of beginner-oriented discussion, not just licensing issues. One of the questions I've asked myself in looking at this list of newsgroups is, "if I were a newbie wanting to ask a question, where would I post it?" I don't think the answer is clear given the above list of groups. Therefore, I propose the following:

Change r.r.a.instruction
to r.r.a.beginner

with the charter: Discussion of questions and answers (both technical and nontechnical) from newcomers to amateur radio, licensing procedures and schedules, instruction, and educational uses of amateur radio. [This includes all topics in the original proposed charter for r.r.a.instruction.]

Since those who want to discuss instructional material are usually either those asking for or those providing beginner's info, this seems like a logical coupling of needs.

r.r.a.digital: Wouldn't r.r.a.datacomm (or r.r.a.dcom?) be better? I mean, "digital" sounds like it refers to CMOS keyer circuitry. Or maybe it only clangs in *my* ear.

r.r.a.construction: I think some of the support for option II comes about because there doesn't seem to be a place for wide-ranging technical discussions. I think the charter of r.r.a.construction allows for such discussion, but again, the *name* of the group doesn't do a good job of indicating that. After all, I might very well want to discuss how an electromagnetic wave forms on an antenna without having the least intention of constructing one (antenna, that is). The rra-reorg mail discussion, and some of the subsequest discussion here, seemed to vacilate between a sweeping "everything is technical" approach and a divide-into-500-little-groups approach to technical discussion. *I* think a general tech group can stand with the other proposed groups. Granting that some of the other groups (products, beginners [if accepted], space) have large technical components, that isn't the primary point of any of those groups. We need a group that does focus on technical discussions for their own sake. And since I can think of no better name, I propose:

Change r.r.a.construction
to r.r.a.technical

with the charter: Discussion of amateur radio technical matters not covered elsewhere, including design, construction and testing of amateur radio and related equipment as well as radio phenomena.

I think these proposed changes would be improvements, but I could
swallow hard and support option I as it stands if that's what shows
up in a CFV.

Before getting too excited about the cable company's maintenence, etc., be sure the interference problem isn't caused by RF getting into the TV receiver on the cable shield. Wrapping a few turns of the cable around the TVI is ralated to harmonic operation. If the cable channel is not a harmonic (or the fundamental) of the transmitting frequency, the TVI is probably not caused by leakage.

>there is there are few people looking for the openings! Listen to the
>beacons and call CQ!

I've wondered why often 10m is dead but there is still a fair amount of 11m SSB operation. Could it be because the 11m folks have no other band to go to? Could it be that propogation is better on 11m because it is 1Mhz lower in frequency? I doubt this. BTW I believe both my radios are healthy and they are on the same multiband vertical antenna.

If 10m is open but the concentration is too low to find any other ops perhaps we need a "dead ban call frequency".

Notice I didn't even mention CB...oops...sorry.

I have a couple questions regarding coax and my HF vertical antenna. I'm a new ham and have a Butternut HF6V vertical on the roof. The coax comes into the shack and connects to a switch setup that connects it to ground when disconnected from the HF rig. (This "ground switch" also has a couple of other antennas and radio attached to it.) It then goes to a static discharge type of unit. Then it goes to an A/B antenna switch so I can choose between my dummy load and the vertical. I understand that every time the coax is "switched" or "coupled" that it loses a significant amount of signal. Here's my question: is this setup too complex and am I losing too much signal? If so, what would be a better way? Maybe I should just come straight from the antenna to the rig and "unhook" when not in use. I tried to set the whole thing up for safety (lightning/grounding) and convenience but I really wonder about signal loss. All suggestions are appreciated. Thanks.

As the sunspot cycle winds down and the dx gets to be more scarce there are some things to consider:

Local 10m nets - to keep the band occupied. Least anyone forget the madness that lurks just below (and nowadays above!) 28 MHz. If we don't use it then 'someone else' will!

Switch to rtty and cw from phone - better for the long haul and short band openings that we will be seeing after this summer.

AM and FM operations - OK so I'm not PC in posting my advocacy of using these 'more spectrum intensive' modes...big deal, they are a lot of fun and with the fade of the dx, very local use of FM and slightly wider use of AM can easily be justified since propagation is down.

High-power - Right, so you've spent the Farm on one of ETO's best ALPHA's; or your junk-box 8877 MONSTER AMP is *finally* done! Well, ok...let's just see what this puppy will do thru the 3 element monobander for 10 meters! Not as many people to work, but a swell test of your new QRO capabilities.

More SSTV - with less and less A3J phone ops crowding the band, there's a bit more space for you SSTV buffs to open up and trade pics. IMHO - high time!

Contests - WHO CARES?! "Yeah..your 5 & 9 too..but could you repeat your call sign slowly and phonetically a few times OM?" Lowered propagation numbers will mean that the RCC people wont be shoved off the band by the Paper Chasers. (suits me just fine...)

QRP - yeah...that's right, QRP! - So ya built (or bought) a little 10m QRP rig. Well now's a swell time to have some fun with it. Lower prop numbers are really a blessing in disguise here, since you won't have as many signals to stomp your 1 watt into the mud. Besides, when the rare openings come most QRP folks are right on top of the situation. Tune your FM scanner to the top of 10m and wait for signals from the repeaters to clue you.

And-then-again-there's-always-the-lower-bands or OSCAR...;-)

OK, mini flame:

WHEN IS THE ARRL GONNA DO SOMETHING ABOUT THE !@#$%^&*()_+ bootleggers FROM 11 meters THAT KEEP RUINING THE 28.0-28.15 SEGMENT? ARE YOU PEOPLE EVEN AWARE OF THE PROBLEM?

<flame off>

This weekend, while visiting my in-laws in Madison, Wisconsin, I noticed
that one of the cable channels was being interfered with from time to time.
Just for the heck of it, I grabbed my 2m HT and repeater directory, set my
HT to each Madison repeater's output, and waited. Bingo! Each time a
certain repeater transmitted, the cable got messed up. Needless to say,
I haven't shared my discovery with the in-laws yet. :-)

Here in Winnipeg, MB (Canada), we are having a similar problem.
The entire southern end of the city seems to be affected by some
interference from some sort of transmitter. It has been there for years
and is getting worse as well as spreading to more chanels. It used to be
limited to CH 17 to CH 19 but now has spread to CH 24 in somewhat rare
cases.

In some areas, the signal almost totaly vanishes (south side of the
central core area). The cable company doesn't care about such things and
has shown no interest in getting rid of the problem.

They have enough garbage chanels. I wish that they would just rearrange
the chanels AGAIN and put the garbage ones (airline schedule?!?) on those
chanels.

I'm ready to purchase a dual-bander rig and have it narrowed down to
two units; the Icom2410 or Icom3230. From what I have gathered these
are the differences. The 2410 can receive two VHF or UHF frequencies
at the same time, the 3230 cannot. The 2410 has electronic squelch where
as the 3230 is knob controlled. The 2410 has a more elaborate remote
cross band repeat function than the 3230 (is this true?).
For only $70 more, I'm wondering if the 2410 is worth it. Any feedback
on both of the units would be appreciated.

thanks in advance,

Steve Kuo, N8OPH, sdkuo@oakland.edu

SB SPACE ARL ARLS016
ARLS016 STS-56 elements

The following represents the latest Keplerian Element Set as generated by
Ron Parise, WA4SIR at the Goddard Space Flight Center.

STS-56
1 22621U 93 23 A 93101.42729449 0.00057240 00000-0 17184-3 0 112
2 22621 57.0073 164.1203 0006381 283.1092 76.9272 15.91824663 522

Satellite: STS-56
Catalog number: 22621
Epoch time: 93101.42729449 (11 APR 93 10:15:18.24 UTC)
Element set: GSFC-011a
Inclination: 57.0073 deg
RA of node: 164.1203 deg Space Shuttle Flight STS-56
Eccentricity: 0.0006381 Keplerian Elements
Arg of perigee: 283.1092 deg
Mean anomaly: 76.9272 deg
Mean motion: 15.91824663 rev/day Semi-major Axis: 6675.3091 Km
Decay rate: 0.57E-03 rev/day sq Apogee Alt: 301.18 Km
Epoch rev: 52 Perigee Alt: 292.66 Km

NOTE - This element set is based on NORAD element set number 011.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

Mark, you're obviously NOT reading the news. I acknowledged a week ago
that I was wrong about the number of articles actually cross-posted to
r.r.a.policy, after Jay pointed it out. I SUPPORT the split. I am already
convinced that the split willl not cause an appreciable increase in
cross-posting. (With the probable exception of stuff cross posted to
r.r.info, :-( )

> If I had a Waffle site downstream of me, and if it were a leaf site, I'd

> Ciao -- Mark

Duplicate articles are not "a serious problem". They are a darn nuisance
that I put up with at the expense of wasted space on my hard drive.
Someone else in this discussion has already pointed out that there is a
program to kill duplicate articles for Waffle DOS boxes, but that only
works if you are the sole reader of news on your machine. And second,
that fails to deal at all with the readers of mailing lists.

I've already said that I support the split, and basically prefer Option
1, with the addition of r.r.a.antennas.

The attitude of some in this discussion, however, that those not running
the latest software, or UNIX, or who are on mailing lists do not deserve
to have their interests considered whatever, is not generating support
for your position.

Robert Smits There is *no* idiotproof filter.

Try going to Radio Shack and ordering one. The manual usually has a part
number and they can get one. Thats what I had to do when I lost the manual
to my 2006. Good luck.

806. AA4RE BBS Mailing list

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-13 04:13:45 UTC
From: enge@almaden.ibm.com
Message-ID: <9304130413.AA15332@ucsd.edu>
Source record: 283376

Thanks to Chris Spell <spell@seq.uncwil.edu>, there is now a mailing list for AA4RE BBS program sysops. I hope all will subscribe. It should be very helpful to all of us.

Roy, AA4RE

- - - -

To send a message to the mailing list send it to:

aa4re@matsci2.uncwil.edu

- - - -

To subscribe to the mailing list a user needs to send a message to:

aa4re-request@matsci2.uncwil.edu

With the following in the body of the message:

subscribe aa4re your_account_name@your.address.whereever

- - - -

To unsubscribe one would send this text in the message:

unsubscribe aa4re your_account_name@your.address.whereever

Thanks for all the replies.
The list above is what I have after one day of digging. Some of the
frequencies came by email, and some from local sources.
I have also receive some informations on the video retransmissions and SSB/HF
retransmissions. I've decided not to include them at this time due to time
constraints and concentrated mainly on 2m and 70cm bands. There are some non-
amateur band frequencies that I've decided to include as part of the list;
you may find them useful if your HT can receive them.

If you are interested in HF/SSB, there is another list available from
N8QLT from compuserve. His email address is 70534,227 on compuserve.

Keep sending the frequencies and I'll keep updating the list.

808. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-13 04:32:26 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.734675546@afit.af.mil>
Source record: 283280

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Thanks for all the replies.
STS-56 is schedule to come down in a few days; I'll be much oblieged of
people living in parts of the country try out the frequencies and
let me know if there are any mistakes. Right now, the list is exactly one
day old.

For the people who have send me mail from packet about the list. I am sorry
, I don't have packet capability. You will have to ask someone else you know
to get the list.

Keep sending those frequencies!!!!

I did a study on CAtv INGRESS about 11 years ago and found that cable
sheath quality, and ground termination aging or corrosion were 2 major
sources of INGRESS. AMong others were people with improperly loaded

terminations, such as splitter connections to their FM radio at 300ohms etc or just open cct. THe MID-BAND channels are always notorious for broadcast interference, even sources like induction motors used on diesel trains cause huge levels of interference, (if you happen to back on a railway).

THe quality of the cable is crucuial with various type and blends of shields, 100% braid coverage is not necessarily best. Dual shieleded coax with braid & foil are generally best with solid copper used on trunks. The cables were replaced a few years ago in WInnipeg to improve on the midband noise shielding and also widen the system bandwidth.

I don't beleive TV's are the cause of noise INGRESS, it's mainly the cable shield and shield grounds. Of course buried cable is best since the ground path lengths are short, but if your city uses aerial cables, then the ground path lengths can become significant sources of ingress along the distribution lines in the neighboorhood.

I usually don't re-post portions of the FAQ, but when the Shuttle is up I guess we have reason to make an exception. None of the items submitted to us for the FAQ are in VHF range from San Diego (unless the ducting turns on strong enough to receive Los Angeles) but the HF frequencies may give you an option you didn't have before.

If anyone has additional information to for this table, please send it to hamradio-faq@amdahl.com
Please provide the same level of detail as the table so we can add it to the FAQ with minimal extra research. Thanks!

Yes, and please note:
Since April 1st, the price of letter, by ship, not air mail, to USA has been
increased from 1.40DM to 2.00 DM in Germany. Thats important for all who enclose
stamps or money into SASE.

Or even a simple dipole. A group of us did this some time ago, ultimately catching an "accidental jammer" - a much respected local ham who was actually building the about-to-be local repeater at the time and had by pure accident left an open mike and real antenna on it while soak testing...but that's another story...

For two metres, take a length of bamboo or similar and make a dipole by taping a couple of 19 inch lengths of wire to it. Make the bamboo about a foot longer than the total dipole length and you have a handy handle.

At the center point of the wire dipole put
a balun if you want to be fancy, or just be cheap and nasty and attach the coax direct. Useless for transmitting, but the dipole's end-on null is sharp, and will give you a better bearing than peaking up on a yagi (assuming the signal is reasonably strong). Take a few cross bearings and you should be able to locate within a few hundred yards quite quickly. Then home in.

It helps if you know in advance what the rough area is - just get together with your neighbours who have beams at their fixed stations and plot lines on a map...

Good hunting - amateur radio is a delightfully diverse hobby, and I can respect devotees of all of its many aspects, except those sad souls whose only pleasure appears to be in spoiling it for the rest. If you can, without laying yourself open to slander, let us know how it turned out.

73, John.

>11 meters THAT KEEP RUINING THE 28.0-28.15 SEGMENT? ARE YOU PEOPLE EVEN AWARE
>OF THE PROBLEM?
>
><flame off>

I'm fascinated by questions like this. What do you think the ARRL can
do? They're not a law enforcement agency. They can't *DO* anything
about it.

They do have an agreement with the FCC that created the amateur
auxiliary to the FCC's Field Operations Branch, but the hams who are in
it likewise cannot *do* anything in terms of enforcement.

They (the hams in the Am. Aux.) *can* be used to gather evidence. But
evidence gathering is tedious, slow, methodical business. People who
are doing it can't talk about it because it might "taint" the evidence.
When it is gathered, then the FCC has to do its thing wich is likewise
slow and methodical. The mills of the Gods grind slowly but exceedingly
fine, as the saying goes. The rash of enforcement actions you see in
the ARRL bulletins are the result of investigations started a long time
before. But this ain't the wild West anymore, buckaroo. We can't just
lynch people even if we know they done it.

If you think the OO's don't know about the problem, write your secion
manager or section OO Coordinator. I'll bet they care just as much as
you profess to.

Do the "new" $.95 IRCs work from Germany? Can I enclose an SAE and one IRC
and expect to receive a single card in return, or is that not enough postage?
How about other European countries? Are these IRCs working as advertised?

Thanks and 73,

823. What should DTMF deviation be set to?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-13 13:51:03 UTC
From: taylor@tix.timeplex.COM
Message-ID: <9304131351.AA07093@tix.timeplex.com>
Source record: 283290

The DTMF tone destined for the PSTN (the telephone network,
that is), should be set to produce a level of -7 dBm per
tone or -4 dBm combined into a regular dial line. Per the
BOC Notes on The Inta LATA Networks document (1990) the level
of -4 dBm is recommended. Assuming full 5 Khz deviation is
equivalent to 0 dBm (the maximum sustained level into a dial
line), a deviation of around 3 Khz will produce a composite
tone level that is about -4 dB down. An easy way to measure
is to modulate the radio to 5 khz deviation with a test osc.
on the bench into a dummy load with a 1000 Hz test tone. Measure
across monitor radio speaker with a flat meter (HP400EL)calibrated in dB.
Use a service monitor if u have acces, instead of the monitor receiver.
Then after noting the level, remove the test tone.
Then depress any touch tone, e.g. the # and the level should be 4
dB lower. If not adjust it to be. Actually the dynamic range of
the DTMF receiver in the CO in a typical Bell office is down to
-25 dBm. But to be reliable if the line is noisy is use the higher
level. If it's say around -10 or -12 I would not be concerned, unless
u have problems with mis-dialing and wrong numbers.

For further reading refer to BOC Notes on the Inta LATA Networks,
1990- SR-TSV-002275 iss. 1.

: work or in the general ballpark? From what I can tell Gray Line should
: work whether the station is at it's sunset/rise times. Thanks for
: any help here! 73!

The gray line is the area of the earth where sunrise is about to occur.
Its not quite in full daylight and its not dark, hence GRAY line. Generally
this refers to making a contact with a DX station when you are both at a
sunrise and sunset. DX signals peak up quite a bit around sunrise on the
low bands. This effect is also seen at sunset (usually to a lesser degree).
If you work a VU on 40m longpath at your sunrise, at the time of year
when its also his sunset time, this sunrise/sunset effect will greatly
improve propagation.

40 meters is a great DX band on CW. Those of us out west work UL, UJ,
VU, etc regularly on longpath in the morning. However this usually
takes place more toward the middle of winter. Its much easier to work
this type of DX longpath, on the lowbands, than shortpath (which goes
right through the Arctic circle).

I do not have an R5 or R7, but I do have a homebrew mast made from fairly
stiff plastic pipe. During the winter it was guyed with polyprop, and
withstood some serious winds. It did not look too pretty so recently I
replaced the polyprop with monofilament - which is a good deal more elastic.
We have had some more strong winds recently (actually blew away part of
my garage roof!). When I looked at the mast, it had been blown over without
snapping, but was now being _HELD BENT_ by the guys. Releasing the guys
allowed the mast to spring back up again. Perhaps guys are not so good??

You are right Gary, there is some volume there! I saw the discussions of
Loran C out of my pocket book range so I ignored them ...

>aside from packet which *still*
>has more posts in misc than packet as witness the latest PK232 vs KAM
>postings.

I am sure some of that problem is due to the fact that we may also be a
victim of the ListServer mentality (or should I call it A-news mentality).
Sure, anyone on the end of a listserver, or has been used to the List will
create some resistance to compartmentalizing the discussion. It is hoped that
posting (or xposting <jab> <jab>) a set of short FAQs every two weeks, with
some dedicated individuals providing email nudges will keep this to a
minimum.

Besides, PK232 vs KAM discussions *belong* in the *.misc Quagmuire :-) along
with my dad is bigger than your dad ;-)

I am disturbed that we have had *little* input from the Listserver users. To
that end, if a listserver user doesn't know where to turn to, in order to post
their opinions to news.groups, I have set up news.groups@ve6mgs.ampr.ab.ca to
cross post to: news.groups,rec.radio.amateur.misc,rec.radio.amateur.packet for
the RFD and CFV period.

We were concerned over the R7 stability in winds at a friends house. We did install it on a windy day. We guyed it about two thirds up (at one of the tubing step down points) with four guys. I've since installed my own and there are several more in the neighborhood. The others are all unguyed. I've not noticed any problem making it through some pretty severe storms (enough to knock over some trees in my yard) nor have I noticed any problem with it's swaying in moderate winds affecting it's operation.

I don't think it will hurt to guy it. I don't think it's required though. There's nothing in the instructions mentioning guying.

-Ron

833. Are old IRCs worth anything? Still usable?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-13 15:38:29 UTC
From: rossi@VFL.Paramax.COM
Message-ID: <1993Apr13.153829.13040@VFL.Paramax.COM>
Source record: 283309

I have several old (15-20 year) IRCs. Do they have any value? Can
they still be used? Would I need to include several? How many?

Some were issued from my local post office (and other U.S.) and some
are foreign (received from other stations).

I stopped using IRCs. I had better luck sending stamps.

834. LAST CALL FOR CD-ROM CONTRIBUTIONS

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-13 15:52:15 UTC
From: flloyd@sunburn.Corp.Sun.COM
Message-ID: <1qenjfINNmb4@west.West.Sun.COM>
Source record: 283310

I'm happy to announce that the the callsign database CD-ROM is nearly ready to go to the printers. If anyone else has any interesting data files that they'd like to contribute to the CD, please send them to me at once. You can either e-mail me the data or leave instructions as to where I can FTP it. We have about 30 megabytes of space left.

The master tape will go to the publisher on Monday Apr 19th and we will expect to have CD's within 2 weeks afterwards.

Thanks already to all those who have contributed. A further announcement regarding the availability of the CD's wil be forthcoming.

835. Re: Hf Cabling ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-13 16:03:53 UTC
From: dstock@hpqmoca.sqf.hp.com
Message-ID: <C5FJAI.30D@hpqmoea.sqf.hp.com>
Source record: 283307

You have nothing to worry about. As long as your switches are of decent quality and have large contacts their loss on HF will be so low that you will not be able to tell any difference should you try direct connection. On 70cm and the microwave bands it would be a different matter, it can be a major task and expense finding acceptable switches.

I ought to mention coax losses at this point, on HF thin coax (RG58 etc) is fine in many cases. Cable loss increases with frequency, and low loss cables are mostly used to try to bring the cable losses back down to acceptable amounts on higher frequency bands. There are some good reasons for going to RG8 (half inch stuff) etc :

1) you have a very long cable run

2) you are using an antenna tuner to match an antenna that is a long way from 50 ohms

3) You have a medium-long cable run on 2 metres

4) you are on any of the UHF and upwards bands.

The Atu bit deserves some clarification, when you are using an atu to tune up an off-resonance antenna, the ATU, cable and antenna become a composite resonator, resonating at your chosen frequency. This resonance causes much larger currents to flow, increasing the power lost as heat in the conductors' resistance. Voltages are also increased, but usually on HF conductor losses dominate insulator losses. This effectively magnifies your cable losses, so a low loss cable can now make a perceptible difference.

Have a lok for some past postings by Gary Coffman on lightning, we don't get much here, but I believe standard US advice is to put arrestors outside the shack not inside, and to have a nice straight downwards path for the strike current.

Hope this helps a bit

Cheers
David GM4ZNX

838. QRM in Hong Kong

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-13 17:43:23 UTC
From: ee_hflo@uxmail.ust.hk
Message-ID: <1993Apr13.174323.25339@uxmail.ust.hk>
Source record: 283228

Dear All Ham over the world,

I am a Ham in Hong Kong. I hold a Class B licence. I can operate
50MHz , 2 meter and 70cm for sat.

There are at least three repeater installed in Hong Kong by
Hong Kong Amateur Radio Transmitting Society (HARTS).

Some of them are free access for all hams and Some of repeater
is for members only.

Since 1991,one of free access repeater (VS6KP) was jammed by
some illegal (guy without licence) using some kinds of jammer.

Their QRM jam the repeat VS6KP everyday least for 2 years.
Members of HARTS make hundreds of complaint to the Hong Kong Post Office
Telecommunication Unit. The guy in Post office just monitor the QRM and
report to us. My godness !!

We will give more presure to the Post office by sending complain
letter to them everyday until the QRM was "removed" :<

I hope that Hong Kong will have clear channel for QSO

As is typical nowadaze, you will probably have to do somebody else's job for them. Although this shouldn't be needed, you might take a few minutes to wander around the neighborhood with an HT sniffing for cable leakage on your freq. after shutting down your system for a while.

If you are fortunate enough to the find the hole, call the cable company and get the highest link in the chain of command you can. Explain the problem, whose job it really is to maintain THEIR equipment, and how much of a nice guy you are to have tracked down THEIR problem for them.

You may have been lucky and made a new contact that could be helpful in the future.

You should always try the 'honey' approach before bringing out the Jack Nicholson impressions..... >:-)

This has worked for me in the past with the power company when tring to find loose/noisy high voltage lines/hardware. Only once did I have to tell them I was narrowing the problem down to a specific pole by bumping a whole line of poles with my car. Got 'em out there THAT NIGHT. And, they didn't have to meet Jack!

As a disclaimer, THEIR method for finding loose hardware was usually whacking the poles with a huge sledgehammer after their high tech arc-finding 'scope couldn't find the problem.

>OF THE PROBLEM?

Personally, I find the "bootleggers" much more interesting to talk to than the hams. It also gives me a chance to work on my Spanish. Any time you try to cram 4 million people into 40 channels you're going to have a problem. I think that we should reallocate a big chunk of 10m to CB. And give them some VHF/UHF also. After all, the "waves" belong to the citizens. Seems sad that after allocations for government, business, international satellites, common carrier, amateur, etc., that the citizens are left with 40 channels. Now I know how the American Indians feel.

I also have a problem with Channel 19 (CNN) - I can often hear people's pagers and there are lines through the picture which come and go with the transmissions. I wrote to the local FCC office and they turned the problem over to the cable company who did nothing. I gave up after a year of letters and phone calls. I got the impression the FCC was powerless and it was up to the cable company to correct the situation.

I live about two blocks from a microwave repeating tower but I'm not sure if the tower is the problem. The problem is very irritating - why can't the cable company, who knew there was a problem with this channel before I wrote my letter, make that channel a blank?

>
>-Roger Bly (ka6mwt)

Sigh. Unless you're just flame-baiting it's pretty obvious to me, at least, that you are simply not in touch with the situation. First off, the actual CB band ends at 27.405, the bootleggers aren't satisfied with just usurping the 27.4051-28.0 slice, OH NO! They've gotta start running AM-SSB-FM voice in the 28.0-28.2 area as well. On top of that, there's bootleggers BELOW the 11m CB band as well, some running as low as 25.5MHz! So, your argument
about the CBers being "..4 million people into (on) 40 channels.." is completly without a shred of truth.

I have absolutly no objections to allocating the CBers some more space, so long as it does NOT impact Amateur bands. Give 'em a legal slice from 27.4051-27.9 and make FM legal, I'd go for that as long as there was some more vigorous enforcement against those that cross over the 28.0 line.

And another thing Mister, if I were you I wouldn't brag about talking to bootleggers, it's considered gauche and might very well prove to be hazardous to your LICENSE!

> and nontechnical) from newcomers to amateur radio, licensing procedures
> and schedules, instruction, and educational uses of amateur radio.
> [This includes all topics in the original proposed charter for
> r.r.a.instruction.]

Except that r.r.a.beginner doesn't broaden the group it narrows the
group. What about discussions of upgrading your current license?
Where does that discussion go? If anything it sound like the charter
needs to be expanded to be more specific about the things to be discussed.

r.r.a.instruction charter: Discussion of instruction and educational
materials and methods, examination and licensing procedures for new and
existing hams. Schedules of time, locations and costs for examinations
and mean time to license arrival. Location and composition of question
pools for the exam elements.

Another possible name for the news group could be r.r.a.education.
As names go this might better target the idea of the group. Any takers?

> Since those who want to discuss instructional material are usually
> either those asking for or those providing beginner's info, this seems
> like a logical coupling of needs.

The logicial place to begin is with the group charter, the FAQ and the
introduction to the r.r.a heirarchy postings. The things that a newcomer
to the group (but not necessarily netnews) would look for. If you think
it is a problem for newcomers to find the information then support a weekly
posting of the introductory postings.

[...]

>r.r.a.construction: I think some of the support for option II comes

>Are there really that many more articles in the mailing list?!?
I am not on the mailing list, despite the fact that I have voiced sympathy for them ... they get a significant cut on the number of articles due to bulletin filtering.

>The rec.radio.amateur.misc newsgroup gets less than 60 per day.
My current average is closer to 100/day, In February, I had about 50/day. I have had days with 250 (this is what I refered to, when I stated throwing the baby out with the bath water, I should have been clearer where I got the number). If I had enough history around to calculate seasonal adjustments, I'd be tickled. So you have to live with my guess that by the time 1993 is ended, I expect to see perhaps 200/day as an average, the peaks will *kill* you ...

I also am voting for the ligitimization of several mailing lists into a new news group (Read: .tcp-ip) that are running at close to the same level of activity as the *.misc group (when they are combined).

If there is a split, you will be guaranteed that the volume will increase because of the new breathing room, I'd hazard a guess that my prediction for volume for *.misc will be dwarfed by the combined volume in the split groups!

>It's pretty easy to follow that amount of load with a decent newsreader.
On a fast machine perhaps, my home machine would make your skin crawl (V7 Unix, 68K at 10MHz) reading the news. `nn' suffers trying to read through the news directory as I have 2900 articles in the *.misc spool just for the past month. I have not complained, but there have been a couple of postings complaining about the volume in *.misc, enough to convince me that we have a problem looming (and thus my reason for the support of the split, although I differ on the lines that should be split ;-).

858. Chassis punches for tube sockets?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-13 22:10:07 UTC
From: rg@futserv.austin.ibm.com
Message-ID: <C5G08v.q0s@austin.ibm.com>
Source record: 283231

My apologies if this is not good place to post this.
Does anyone know where I can buy chassis punches to make
holes for tube sockets? I am discovering tubes for the
first time, and having a lot of fun playing with them,
but the blinking holes for sockets are driving me crazy.
Even old used punches would be a help.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

I purchased a Yaesu 530 last month from Tom at Ham Radio
Outlet in San Diego. I performed the out-of-band receive modification
according to Yaesu's data sheet. Unfortunately, the rig went bad
after about a month (the RF amplification circuits I believe). Upon
returning the rig to HRO in San Diego, I was sent a new replacement
NO QUESTIONS ASKED and NO HASSLE ABOUT THE MOD. I have seen criticisms
of HRO in this group before and just wanted to pass along my kudos to
them for customer satifaction beyond the call of duty.

Fredric Einstein
(Not associated with HRO but a VERY satisfied customer)

Date: 1993-04-14 00:27:28 UTC
From: KA6ETB@GRAFex.Cupertino.CA.US
Message-ID: <gate.H5Ry2B1w165w@GRAFex.Cupertino.CA.US>
Source record: 283237
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc

All you might ever want to know about the KA6ETB HAM-server

Hardware:
========

386/25 PC clone
Telebit QBlazer modem
10-Meg file space reserverd for archive

Software:
========

Waffle 1.65
WFSmail 2.03

General Information:
===================

Orders for files are filled between the hours of 0100-0500 daily, Pacific time. This is so those hosts through which the traffic is forwarded are not overloaded. Since we all depend on the generosity of others to carry the mail, it behooves us not to make them angry.

There is a daily limit of ALL requests of 3-megs. If there are a series of files you want to order, stretch them out over a few days, rather than ordering all at once. That way, you are almost assured of getting them all, and you won't be blocking others from getting their orders filled.

ASCII (text) files are split at about 59,000 bytes. UUENCODED binary files are split at about 750 lines.

/hamradio/newfiles/ contains files that have not yet been categorized.

A new INDEX is automatically generated every Sunday.

New files are being added and old files are being changed and updated. You might want to send a order for NEWFILES <date> from time to time, to see what's new. <date> has the form of MM-DD-YY and is required.

Ordering Information:
====================

Send an email to:

HAM-server@GRAFex.Cupertino.CA.US

In the text of the message, place:

HELP
INDEX
GET /hamradio/00-INDEX.TXT

HELP will send you the HAM-server HELP file. This is processed immediately
for return delivery.

INDEX will send you an index of the files and the directory they are in.
00-INDEX.TXT is a description of most of the files in INDEX. This file
is in a continual state of flux, therefore many of the file names listed
therein may not match INDEX, but you can figure it out.

A new index is automatically generated every Sunday night.

If you are using a PC and you do not have UUDECODE, follow these steps:

1. Order UUDECODE.BAS or UUDECODE.C, and UUEXE515.ZIP.
2. Compile UUDECODE.BAS or UUDECODE.C on your system.
3. Use the resulting executable to UUDECODE UUEXE515.ZIP. UUEXE515 has
documentation about UUENCODE/UUDECODE.

You are all set to start ordering binary files from HAM-server.

Some Reasons Why Ordered Files Are Not Received:
==========

1. Your return path is incorrect. My bounce mailbox fills up quite
regularly with messages. And, since the path is incorrect, I cannot
contact you to let you know.

2. You have spelled the file name incorrectly. Use the file names
listed in the INDEX, rather than 00-INDEX.TXT. The latter is only
a guide.

3. The file name has changed since the INDEX was generated. Order a
new INDEX.

4. Your order was sent to KA6ETB@GRAFex.Cupertino.CA.US, instead of
HAM-server@GRAFex.Cupertino.CA.US. File requests sent to me
will not be honored (naturally).

5. The 3-meg daily limit has been reached. Try again.

~From ARRL Headquarters
Newington CT April 13, 1993
To all radio amateurs

SB DX ARL ARLD018
ARLD018 4N5 YU5 OK OL OM news

Macedonia (former Yugoslav republic), Czech Republic, Slovak Republic added to DXCC Countries List -- Czechoslovakia deleted

Today, the ARRL Awards Committee voted unanimously to accept a recommendation of the ARRL DX Advisory Committee (DXAC) to add Macedonia (former Yugoslav rep) (4N5, YU5) for contacts made 8 September 1991 and after. This is based on DXCC Rules Section II, Point 1 (Government).

The Awards Committee also voted unanimously to accept a DXAC recommendation based on DXCC Rules Section III (c) (Partition) to delete Czechoslovakia (OK-OM) effective 1 January 1993. (Contacts made 31 December 1992 and before count for this deleted country.)

Replacing Czechoslovakia, effective 1 January 1993, in accordance with the DXAC recommendation, are the Czech Republic (OK, OL) and the Slovak Republic (OM). These additions to the DXCC Countries List are by reason of Section II, Point 1 (Government) of the DXCC rules.

The DXCC Desk will accept QSL cards for these three new countries starting 1 June 1993. QSL cards received received at the DXCC Desk before 1 June 1993 will be returned without action.

865. Give 10 meters to CB!?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 01:11:13 UTC
From: mellob@cary112.its.rpi.edu
Message-ID: <w6q59sp@rpi.edu>
Source record: 283243

(I can tell already, this subject is going to EXPOLDE!)

bly@btree.uucp (Roger Bly) KA6MWT writes:

>I think that we should reallocate a big chunk of 10m to CB.

Why on earth would anyone want to do that!

usenet@ttinews.tti.com (Usenet Admin) (Erik Sorgatz) writes

>I have absolutly no objections to allocating the CBers some more
>space, so long as it does NOT impact Amateur bands.

Well, this is a little better.
In my opinion, it would be O.K. to extend the Citizens Band

- IF -

1.) CB users used what they already have in a
more respectable manner.

2.) They did NOT get any of what is currently the
Amateur 10 meter band, 28.0 to 29.7.

3.) The "buffer zone" between 27.405 and 28.000
remains intact. I think there is an absolute
neccesity for these "buffers" between allocations.
Just think how much further into the 10 meter
band bootleggers would go if they could initially
make it to 27.999 BEFORE modifying their radios!

So maybe if CBer's improved their operating practices a little,
a little extra room on the low side wouldn't hurt. As long as
there is still some sort of buffer zone between the next
alloaction. (Is it 12 meters or is there something else in there?)

BTW, I am NOT plugging CBer's. There are some very nice
people out there and I am a CBer myself.

>> I had a similar thing happen to me several years back, while I was still

>I regularly have QSOs with V31FX on 10m when the band is "dead". We
>(W5YM) have a TS430S and a HyGain tribander, she has an IC725 and a
>trap dipole.

>Of course, yesterday either V3 was in the skip zone or 10m was *really*
>dead. Nada.

This really happened: When I was 14, my dad and I put up a 10-meter
3-element beam, and when I fired things up, there was *nothing* but
hiss on the band. So I called CQ and had a pileup of JA and other
Pacific rim countries calling me. In a few minutes, it seems,
everyone stateside realized that 10 meters was wide open. In any
case, my first time on 10 meters lasted for hours and hours. But some
naive new General had to call CQ first.

That was when I was naive, new, and general. Now, if no one's
talking, I give it a shout. Hey - you can't lose: if no one hears
you, no one knows you called. If someone (even local) hears you, you
make a new friend.

Works for me.

73,

Dave

MACEDONIA (FORMER YUGOSLAV REPUBLIC), CZECH REPUBLIC, SLOVAK
REPUBLIC ADDED TO DXCC COUNTRIES LIST -- CZECHOSLOVAKIA DELETED

TODAY, THE ARRL AWARDS COMMITTEE VOTED UNANIMOUSLY TO ACCEPT A
RECOMMENDATION OF THE ARRL DX ADVISORY COMMITTEE (DXAC) TO ADD
MACEDONIA (FORMER YUGOSLAV REP) (4N5, YU5) FOR CONTACTS MADE 8
SEPTEMBER 1991 AND AFTER. THIS IS BASED ON DXCC RULES SECTION II,
POINT 1 (GOVERNMENT).

THE AWARDS COMMITTEE ALSO VOTED UNANIMOUSLY TO ACCEPT A DXAC
RECOMMENDATION BASED ON DXCC RULES SECTION III (C) (PARTITION) TO
DELETE CZECHOSLOVAKIA (OK-OM) EFFECTIVE 1 JANUARY 1993. (CONTACTS
MADE 31 DECEMBER 1992 AND BEFORE COUNT FOR THIS DELETED COUNTRY.)

REPLACING CZECHOSLOVAKIA, EFFECTIVE 1 JANUARY 1993, IN ACCORDANCE
WITH THE DXAC RECOMMENDATION, ARE THE CZECH REPUBLIC (OK, OL) AND
THE SLOVAK REPUBLIC (OM). THESE ADDITIONS TO THE DXCC COUNTRIES
LIST ARE BY REASON OF SECTION II, POINT 1 (GOVERNMENT) OF THE DXCC
RULES.

THE DXCC DESK WILL ACCEPT QSL CARDS FOR THESE THREE NEW COUNTRIES
STARTING 1 JUNE 1993. QSL CARDS RECEIVED RECEIVED AT THE DXCC DESK
BEFORE 1 JUNE 1993 WILL BE RETURNED WITHOUT ACTION.

SB SAREX@AMSAT $STS-56.015
STS-56 Central US Rise/Set Times, 4/14-16

Below are the rise and set times for STS-56 for selected US cities
over the next three days. This data was generated to help hams without
orbit programs to participate in the SAREX activities. Please note
that the times shown are UTC and NOT LOCAL TIME. For information
regarding SAREX frequencies and operations procedures, check your
local PBBS, or bulletins from W1AW, W5RRR, W6VIO or WA3NAN.

873. Kenwood TM-732 Questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 04:44:58 UTC
From: jmeyers@ecst.csuchico.edu
Message-ID: <1qg4saINNnip@charnel.ecst.csuchico.edu>
Source record: 283249

Howdy Folks!

I just bought the Kenwood 732 mobile dual-band radio and have found the manual "less than clear" about topics such as crossband repeat, remote control, etc...

Do you have these functions figured out? Found any undocumented ones?

I was wondering why I haven't heard more about this radio-- seems to be a great combination of features and price!

Please send me mail if you have anything to share, or anything to ask...

>>sometimes treated more like pets than people. Not only were there
no girls or women among the 20 or so applicants at the VE session
I went to, but none of the VEs were women.
>>

I was rather perplexed at this well intentioned comment. Why would it
matter if there were VEs who were women or not? We should really not
care if they are women, but simply, if they are qualified.

Organizations shouldn't have to divide positions based on the fact that
there have to be percentages of various genders and races and such. The
fact of the matter is, you utilize who will get the job done, regardless
of who they are, what nationality they are, how much money they make, or
how they choose to pray (or lack thereof).

Congrats for coming back into ham!

877. Receiving Amateur TV

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 07:22:13 UTC
From: ara@zurich.ai.mit.edu
Message-ID: <ARA.93Apr14022213@camelot.ai.mit.edu>
Source record: 283251

I'm not very knowledgeable about ham radio or equipment, but I am somewhat affiliated with the amateur radio club at the University of Rhode Island (by the way, I don't live in the Boston area, so please don't refer me to stuff at MIT). Anyway, I'm trying to interest them in developing the capability to receive amateur television. In order to do this, it is my job to find out what equipment is needed and what it costs.

The club has a 286 PC clone and a not very impressive monitor. It also has a TNC, antenna, etc. The TNC is an AEA PK-232.

I was told by someone that in order to pick up Amateur TV, one only needs to have a board for the PC, maybe a new monitor (unspecified) and a chip for the TNC.

Can someone tell me EXACTLY what one needs and what it costs and where to get it cheap? It's useless to tell me to look in QST and other magazines for ads, since I am not yet knowledgeable enough to decide whether they are really meeting the need or not. NOrmally, I would take the time to learn, but I am under time pressure on this.

: ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
: I recall reading in NASA tech breifs that ordenary light switches work to
: at least 1 GHz with out much problem.
: Gordon AB5Dg

Surprisingly, those cheap slide switches with the pressed tin frames work quite well at RF. I know one antique sampling scope that used them to 1GHz to switch the trigger input directly.

As the original question is from someone who said he was just beginning in radio, I think it's important to say when special circumstances are involved:

Ordinary lightswitches

I'm in Scotland, with all domestic power at 240v, and fierce regulations about electrical safety, our ordinary lightswitches are very different to US models. It is likely that the NASA tech brief concerned one type commonly available in the USA, the problem is you need to know which one, as there will likely be plenty of others which are useless.

Switching RF

Any switch will switch RF, although the performance could be anwhere between superb and useless for whatever purpose involved.
A good switch has to provide:
Minimum loss on the selected path
Maximum isolation on the un-selected paths
Minimum reflection (=good VSWR) on the selected path
Reliable operation at the power level involved.
Minimum signal radiated, minimum activity as an antenna.
It is very difficult to get all of these up to the performance usually wanted at UHF and microwave, it is much easier at HF. At UHF some can be done easily, but getting the whole lot right at once is much more fun.

Mounting

If you find the right switch, and it was found to work well enough for you, just check to see how it was mounted, if any screening was added, and how cables are attached. This can be more important than the rest of the switch.

For HF, you can get away with murder. You can make switches out of junk that work as well as anything in your local amateur radio shop, you can make open line feeder from scrap wire and old ballpoint pen tubes that have lower loss than any available coax. There is something very

satisfying about this.

Cheers
David GM4ZNX

880. dualband HT with alpha display???

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 11:22:53 UTC
From: hemstree@lamar.acns.colostate.edu
Message-ID: <HEMSTREE.93Apr14062253@lamar.lamar.acns.colostate.edu>
Source record: 283258

My wife recently passed her tech-nocode and I am looking for a dualband HT that has an alphanumberic display. Particularily, I am looking for something that will display a short phrase with the frequency to help her keep the freq's straight. So if she was on 145.115, the display would also say NCARC Repeater. Or 147.570 Simplex1... you get the idea. Any recommendations?

|> they don't know how to deal with the monster they've created,
|> or their irate customers (who probably are demanding refunds).

How could they have done otherwise?? Cable frequencies start at 2 Mhz and
go up to almost 1 Ghz according to the published industry standards.
Most Cable TV starts at 54 Mhz and has at least 38 channels. Let's see,
38 * 6 = 228!! That makes it from 54 Mhz to 282 Mhz. That covers 2 ham
bands (and pretty clos to a third) and dozens of other sevices. Short of
fixing their leaks, there is no way to avoid interference. At least until
they get the fiber in. ;-)

Geez. We need to add this to the FAQ:
CATV Channel 17 138-144Mhz
CATV Channel 18 144-150Mhz
CATV Channel 19 150-156Mhz

I dunno about Canada, but channel 18 sure looks familiar! ;^)

Cadet Amateur Radio Club Station W2KGY will operate a Special Event
Station from Constitution Island on April 17, 1993 from 1400Z - 2000Z
to commemorate the role that the island has played in American history.
Operation will be on the following phone subbands (MHz):
3.85-3.86
14.225- 14.235
21.30-21.31
28.30-28.31 (Conditions Permitting)

Constitution Island is located approximately 100 Km north of New York City
on the Hudson River. It is directly adjacent to West Point and is the site
of the first fortifications authorized by the Continental Congress
during the American Revolution. It served as one of the first 'Veterans
Hospitals' after the revolution. In the later half of the 19 Century, it
was the home of the Warner Sisters -- well known American authors with over
100 books to their credit. The island was donated to the US Government in
1908 for use by the US Military Academy at West Point.

No problem at all! This last spring in Phoenix we had three cars with ATV in the electric car race. WE did put controller boards in each car and had a call sign for each car. We used three different bands too (440,1200,& 900). Anyway it worked quite well and it was neat having video in each car when all three raced in the same race. So go for it and enjoy it!

891. Info On HF Rigs Needed

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 13:53:08 UTC
From: sims@zds-oem.mi04.zds.com
Message-ID: <1993Apr14.135308.18622@zds-oem.zds.com>
Source record: 283277

The amateur radio club I belong to wants to purchase some new HF gear. The rigs they are looking at are the Yeasu FT-780, and the Icom IC-737. They both look nice and have comperable specs, but other than the spec sheets, no one I know has one or can offer any other info on them. There primary use would be contesting, but they would be used for emergency equipment if there was a need.

Does anyone have any practical experience (or know of anyone who has) with these rigs?? All information is welcome (flames if you got them). Also, if you know of anyone with a good price, tell me (we are looking at about $1100).

Thanks in advance.

Mike Sims, KA9KIM

892. Re: Building a J-pole

>and what bands it can be used for would be
>appreciated. Replies can be put on net or
>emailed to me.

Just for net.info: every since I cleaned up some problems with
j-pole designs I'd found on packet ages ago and wrote an article
showing a simple way to build it, I have routinely forwarded
the plans for a copper tube j-pole or tv twin-lead j-pole to
anyone that requests it. I have sent the files to the CD-ROM
assemblers, and expect the plans to appear there as well.

There is probably no need to flood the net with reposts of my
article when requests of this type appear. I do occaisionally
repost it myself if I see a flood of requests that indicate to
me that a new group of readers has come on the net and makes
it worth net.casting.

P.S. I also have simple plans for a really nifty little
multi-band wire antenna that has enjoyed much popularity.

Use a cable ready TV, tune to channel 57 (55-60 is most common), and
besure to use a 440 (actually 420MHz is best) beam and point it towards
the ATV transmitter.

Good luck,
Tom

Ex-FCC head dies

Former FCC Chairman Robert E. Lee died April 6, 1993, and was
remembered by the Commission as its longest-serving commissioner.
Lee, who was born in Chicago in 1912, was a commissioner from 1953
to 1981, having been appointed by President Eisenhower and
reappointed by Presidents Johnson and Nixon. He served briefly as
chairman of the Commission, from February 5 to May 18, 1981, in the
initial days of the Reagan administration.

Before joining the FCC as an auditor Lee was an FBI special agent,
an administrative assistant to FBI Director J. Edgar Hoover, and a
Director of Surveys and Investigations for the Appropriations
Subcommittee of the House of Representatives.

To all radio amateurs

SB QST ARL ARLB040
ARLB040 More power denied

More power denied

The FCC has denied a request for a waiver of the amateur 1,500 watt
power output limitation. Dale Gagnon, KW1I, of Bowe, NH, had asked
for the waiver earlier, as well as a reconsideration of the FCC's
original denial. The FCC said that Gagnon's latest request for a
waiver ''has not shown that his circumstances are unique nor has he
presented any facts that would warrant a waiver.''

Gagnon wanted the waiver for his own use, to legally operate on AM
at a PEP power more than 1,500 watts output.

SB QST ARL ARLB041
ARLB041 Electronic filings

Electronic filings

The FCC on April 1 changed its rules to allow for the eventual
''electronic'' filing of license applications in the private radio
services. Currently all license applications must include a
handwritten signature. Last October Congress amended the
Communications Act of 1934 to allow electronic filing of
applications, applications signed ''in any manner or form, including
by electronic means, as the Commission may prescribe by regulation.''

Any changes to come will only be after the FCC has established
procedures for electronic filing; for now amateurs, and all others,
are still bound by the handwitten signature requirement.

>bill wb9ivr

The FCC gave up issuing licenses for CB at least 15 years ago. All
one needs today is the CB rig. NO license required.

Despite that, I see no probability that the FCC would reassign the CB
frequencies to hams. The CB channels, whether one cares about them
or not are used and are heavily populated. Also
as others have pointed out, the usual "uncrowded
conditions" of our 10m band doesn't provide any solid argument in favor
of enlarging the 10m band.

Seems to me we need to better utilize 10m before we ask for more
adjacent frequencies to the 10m band. I don't see why many local
net type operations can't use 10m, especially at night. I'd
think that would be better than running the same net on a 2m
repeater or 2m simplex.

Just my thoughts.

>No matter your clock is twelve hours off...you made the contact.
>Congratulations!

Whoops, as you probably guessed I meant 1300 which is why I have a clock set to UTC in my shack. Was really pleased to work that Taiwan station! I had the mistaken notion that the gray-line was set in stone and didn't wander a bit so that the countries along the gray-line would always remain the same. After playing with a program that shows the gray-line around the world, it definitly wanders a bit and various parts of the world show up along it according to the time of the year it is. Now if I could only get up early enough to work it. 8-) 73!

Sorry... I was too fast with the proofreading. The two sentences aren't directly related. The second part of that should have been introduced with my observation that amateur radio still seems to be a mostly male hobby. The first part relates to references to women in amateur radio publications. I agree that counting heads isn't necessarily a good test of a group's attitude.

>materials and methods, examination and licensing procedures for new and
>existing hams. Schedules of time, locations and costs for examinations
>and mean time to license arrival. Location and composition of question
>pools for the exam elements.

I have no problem with that, except that it still doesn't provide a
place specifically for beginners, which I think is needed. Beginners
tend to find it difficult to categorize their questions. That's one
reason why you see so many beginners' packet questions in r.r.a.misc,
for example. If we want to provide an environment friendly to the
beginner--and I think we do--we can best do so by giving them a place
to read and post that specifically addresses their questions about
all of ham radio, not just licensing. And in any case, I think most
of the licensing discussion is about beginner licensing anyway. If
that discussion takes place in a beginner's group, what little is
left can easily be handled in r.r.a.misc.

>Another possible name for the news group could be r.r.a.education.
>As names go this might better target the idea of the group. Any takers?

It doesn't target the group *I* want to have.

>> Since those who want to discuss instructional material are usually
>> either those asking for or those providing beginner's info, this seems
>> like a logical coupling of needs.

>posting of the introductory postings.

I'm talking about chartering a group that gets beginners together with
the folks who provide them with answers and support. By "beginners"
I mean newcomers to ham radio. They may or may not be newcomers to
netnews. If we name such a group r.r.a.beginners, I suggest we won't
have to rely on periodic postings to lead beginners to the appropriate
starting point. It's perfectly clear from reading not just the r.r.a
hierarchy but others as well that FAQ and other periodic postings have
only limited success in directing people to the right places. So what's
wrong with establishing groups and picking group names that *do* provide
direction if the resulting group can stand on its own with respect to
traffic volume?

>[...]
>

>
>What about the charter for r.r.a.misc? That allows for wide ranging
>technical discussions. What is the problem with using r.r.a.misc?

Simply that r.r.a.misc is too broad-brush. Discussion areas that have
significant traffic volume should be in a unique newsgroup. That best
serves both those who want to read about that subject and those who
don't. I question whether construction by itself will support enough
traffic. And at the same time, I think general technical discussion,
if it's placed in r.r.a.misc, will have a large enough volume to annoy
the r.r.a.misc readers who aren't interested while not being a high
enough percentage of the total r.r.a.misc to allow the techies to
efficiently filter the technical postings from the other r.r.a.misc
stuff. So, since construction is a subset of the subject of technical
matters, I think they should go together in a newsgroup.

This can be hazardous! When I was in graduate school, I had a 20 beam on top of the house we were renting and had a regular sked with a friend in Australia. I started getting serious interference from a nearby powerline tranformer which was easily isolated first with the beam and then with a portable AM BC radio. So I called the power company and told them that they had a bad transformer. Nothing happened until, two weeks later, the transformer failed spectacularly.

About a month after that, the next transformer in line (about a block away) started to put out interferance. I called the power company again, this time I went further up the chain. Still nothing was done until *that* transformer caught fire. A short time later, a third transformer in the neighborhood also started to put out noise. I called again (I figured 1) the transformers were near their design lifetime and the power company maintenance people would eventually figure this out and replace all of them and 2) by now they would listen to me!). What happened was that I got a call from the local FBI office. They (politely) wanted to know what I had done to upset the power company. So I explained the situation. I had been reported to the FBI as possibly sabotaging a public utility! Fortunately, the FBI had had a couple of previous calls from the power company trying to use them to harrass individuals that had been fighting various power company actions.

Apparently, nothing came of this as I had no problem with my
security clearance :-)

Message-ID: <1993Apr14.152206.25654@linus.mitre.org>
Source record: 283128

There's an important distinction between *electronic* amplification
and *electrical* amplification. Bell gave public demonstrations
of his telephone in the late 1800s using special receivers optimized for
loudness. These were, however, not "electronic" in the usual sense of
using active devices like vacuum tubes or transistors, but purely
"electrical" in that they used only passive devices.

Well Vern, switch losses at HF are really minimal under most conditions
so I wouldn't worry much about that as long as the switches are of
good quality with adequate current handling and adequate isolation.
I=sqrt(P/R) and V=sqrt(P*R), so for the matched case a 100 watt signal
into a 50 ohm impedance gives sqrt(100/50)=1.414 amperes and sqrt(100*50)=
70.71 volts. A legal limit signal would require a switch with a 5.48 amp
carrying capacity and a voltage rating of 273.86 volts. High SWR can cause
the current or voltage maxima to be much greater. Most any switch is
suitable for 100 watt matched levels, but legal limit, and high SWR
conditions, place greater restraints on voltage and current handling.

Isolation can be a tougher problem. Our enemies are capacitance, and
in some cases inductive coupling. For many moderate to high current
switches, there is a significant capacitance between the open contacts.
This gets worse with increasing frequency as the reactance decreases.
This is one reason the knife switch is popular. It has minimal capacitance
between the contacts because of it's physical design. Inductive coupling
can also play a part in reducing isolation. Usually, this is because
of internal switch lead layouts that allow parallel, or nearly parallel
coupling loops. This becomes less at higher frequencies as the reactance
decreases. The best coax switches use a rotary butterfly contact in
machined cavities. Few switches can maintain 30 db of isolation between
contacts. Most are considerably worse. For a legal limit signal, 1.5 watts
could be coupled where you don't want it to go with the best switches. Most
receiver front ends would be unhappy at this level, and if you were using
a dummy load, your antenna would still get a good QRP signal to radiate.

Then there's lightning. Now we're talking about 20,000 amps and up to 1 million or so volts (though RG-8 will flash over at about 8 kV and act as a voltage clamp). We have to be very careful in laying out cable systems that may be subjected to lightning. Coaxial switches don't break the shield path of the cables attached to them, so switching the radio to an open circuit doesn't give much lightning protection unless single point grounding practice is followed and good gas discharge suppressors are used. This is not always obvious because more than coaxes are involved in shack wiring. Power wiring, telephone wiring, accessory interconnect cables, etc can all form part of a ground loop for lightning currents. Any ground loop is an invitation to disaster.

The usual professional method of dealing with these problems is to use a ground "window" approach to all cables entering and exiting the shack. This is one small area where all cables terminate in suppressors and where all shack grounds are terminated. This ground window is tied directly to a good earth ground by a heavy and straight cable. For best results, this plate should be mounted on an outside wall. For switching, most professional stations use a patch bay. There are two kinds of patch bay, insulated and grounded. Insulated bays can be very useful in breaking any inadvertent ground loops, and the grounded bays can serve as part of the ground window. The simplest patch bay is a rack panel with a bunch of BNC chassis feedthru female connectors mounted through it. You can then use short patch cords to connect anything to anything else. For an insulated bay, use plexiglass for the panel. To avoid mutual coupling, it's best to put all low level connections on one end of the panel and all high level connections on the other. Also resist the temptation to neatly dress your cables in bundles. This increases mutual coupling.

Yaesu FT-5100/FT-5200 MODS
Rev B (14 Apr 1993)

This is a collection of hardware and software mods for the Yaesu 5100/5200 pair. I have the 5100, so I can't verify these for the 5200. I have collected every mod seen on the net (ie. Usenet) since the introduction of the 5100, so I think this list is fairly complete. I am interested in getting updates and corrections to this list, so please send me e-mail if you find something that needs updating. (This includes typos, wrong or missing attributions, caveats, warnings about unmentioned side effects, serial numbers of radios that won't do some of these mods, etc.)

SOME OF THESE MODIFICATIONS MAY DAMAGE YOUR RADIO IF YOU PERFORM THEM IMPROPERLY. WHEN IN DOUBT, DO NOT PERFORM THE MODIFICATION.

This advice is free, so remember that you get what you pay for.

Brian McMinn (brian.mcminn@amd.com)
N5PSS

General Review (5100):

Since Yaesu's advertising has already made the good points known, I'll concentrate on the warts and shortcomings.

Dual In-Band Receive: works as advertised except for sensitivity. The "main" receiver works very well. The "sub" receiver works very well when tuned to the opposite band from the "main" receiver. When tuned to the same band, the "sub" receiver suffers from slightly lower sensitivity in the ham bands and greatly reduced sensitivity out of the ham bands.

There is a 2m VCO/PLL/IF and a 70cm VCO/PLL/IF. I assume that dual in band receive is done with the opposite band's

receiver. This would explain the poor sensitivity, but it sure raises some questions about how the duplexer works.

I expected a type "N" connector, the radio came with UHF.

Control wart: (are you listening Yaesu?) You can only transmit on the "main" (ie. left) side of the radio. When both 2m and 70cm receive are active, you change bands with the "BAND" button. This swaps the left and right displays. When dual in-band receive is active, the "BAND" button changes both the main and sub receivers from 2m to 440 or from 440 to 2m. Arrrgh!!!! I would prefer a "SWAP" button to swap left and right regardless of mode. (The "SUB" button is used instead.)

Automatic backlight dim: works as advertised but the backlight level under low ambient lighting is WAY too low. Manual control is the best solution.

DTMF page: works as advertized, but the *&%$#@ thing insists on "ringing" like a phone EVERY time it receives the page sequence. This means that you have to co-ordinate with the other station to turn the *&%$#@ DTMF stuff off at the same time or tolerate the "ring" at the start of every receive.

CTCSS decode: squelch opens quickly when normal CTCSS decode (an option) is enabled. There is a CTCSS page function that has a distinct delay between receipt of carrier with CTCSS and open squelch. I don't yet understand the use of this "feature."

There is no SCAN button on the front panel. Scan is initiated by holding the up or down button of the mike down for two seconds. The scan is blindingly fast when compared to the Alinco 590 that I used to have.

Memory: memory is divided into four "banks." Two for VHF, two for UHF. Only one bank can be active for each receiver. I consider this an advantage, but you may not. There are two obvious (to me) uses for this configuration. First, you can store freequencies for different uses in different banks. Second, you can activate one 2m(440) bank in the main receiver and one the other 2m(440) bank in the other receiver and scan them simultaneously.

Heat management: After seeing the HUGE heat sink on the back of the Alinco 590, the Yaesu 5100's sink seems too small. In a key down experiment, the heat sink of the Yaesu got almost too hot to touch before the fan kicked on. If I were planning to run a packet station, I would definitely look into some extra forced air over the back of this one. As it is, I'm a bit concerned about how hot it will get mounted in my dashboard. [Others people don't seem to have this problem.]

DTMF Decode and Scan: If you have CTCSS decode (an option) enabled on a memory and you are scanning and there is activity on that frequency but without the correct CTCSS tone, the 5100 stops scan, flashes the strength meter and then continues scanning. It is slower than normal scan, but still quite fast.

-=-=-=

time limit is exceeded.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-=-=

It interfaces to the rig via a standard mic plug. The receiving unit is only about 1'h x 2w x 1/2d.

[ed] The implications of this are that the entire radio can be controlled via the microphone port! Too bad there isn't a fancy *wired* mike with all the controls on it.

Several people have reported trouble with the mike -- enough trouble for them to return it because of poor range and poor audio. It works well if you sit on top of the pickup unit, but then you don't need a wireless mike.

Attributed: Tony Pelliccio, KD1NR system@garlic.sbs.com

-=-=-=

NOTE There are no numbers on the circuit board so you will
have to match up with the diagram below.

6) On the rear of the Control head locate, Unsolder and remove
jumper Pad R4072.
7) Solder across jumper pads: R4070 R4068 & R4064 (use wire or
0 Ohm resistor)

NOTE If you want to change the D/MR button on the
microphone to do Band Switching, now is the time.
See the next mod.

8) Install Front Control head, Speaker, Top and Bottom Covers
and Reconnect Power to the Radio.
9) Press and hold [D/MR] [F/W] [REV] Keys and turn on the Radio.
Radio will now show 300.000 & 20.000 on Display.
10) Set UHF Rx Low - Press [MHz] and dial 420.00, press [D/MR]
11) Set UHF Rx High- Press [MHz] and dial 475.00, press [D/MR]
12) Set UHF Tx Low - Press [MHz] and dial 420.00, press [D/MR]
13) Set UHF Tx High- Press [MHz] and dial 450.00, press [D/MR]
14) Set VHF Rx Low - Press [MHz] and dial 128.00, press [D/MR]
15) Set VHF Rx High- Press [MHz] and dial 180.00, press [D/MR]
16) Set VHF Tx Low - Press [MHz] and dial 140.00, press [D/MR]
17) Set VHF Tx High- Press [MHz] and dial 150.00, press [D/MR]
18) Set UHF offset - Press [F/W] then [RPT] dial 5.000 press [RPT]
19) Set UHF tuning - Press [F/W] then [REV] dial 25.0 press [RPT]
20) Set VHF offset - Press [F/W] then [RPT] dial 0.600 press [RPT]
19) Set VHF tuning - Press [F/W] then [REV] dial 20.0 press [RPT]
(VHF tuning step varies by state -- many use 15.0)

Diagram: [there are no tabs in this section - ed]

Ok, here's where it gets tricky, but so you know, a '|'
represents a jumper.

Wow, what a price difference for the same prouduct in different countries!
The TS50 sells in Holland for about HFL 2750. (About $1600). On the
net I read that the same product costs about $1000 in the US. Does anybody
have experience ordering and shipping equipment from the US to Europe?
What are the additional shipping and tax expences? (Is there a way to
avoid taxes?)
Any info on this subject welcome!

I have never heard about a HF rig called FT-780. Do you perhaps think of the FT 890 or is it a very new one?
What specs do you know of the IC-737? Here in Germany I havn't heard anything about it yet.
What are the differences compared to the IC-735?

If you get mail about the rigs could you post a summary?

Thanks, Matthias

914. Looking for Contest Logging Software

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 17:56:43 UTC
From: majewski@spsd630a.erim.org
Message-ID: <MAJEWSKI.93Apr14175643@spsd630a.erim.org>
Source record: 283174

Hello!

I am interested in getting some contest logging software for both the
PC and the Mac. My immediate need is for Field Day, but I'd like to
be able to use the software for other contests as well.

I have heard of CT and NA, but is there anything else out there?

Also, can anyone provide ordering info for this software or, if the
software is public domain, an FTP site?

Thanks and 73!

Ron (wb8ruq).

915. Re: Building a J-pole

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 18:02:23 UTC
From: edh@hpuerca.atl.hp.com
Message-ID: <C5HJG1.3CC@hpuerca.atl.hp.com>
Source record: 283135

Okay. Since I got seven requests for the plans in a 20 minute timeframe (all already responded to), I'll take it there is some current net.interest and hereby notify r.r.a.m that I am about to post three articles covering the plans I mentioned before. To keep the plans "clean" of other garbage (so they are easier to save and print (one side one page, by design), I'll make my remarks here:

1. I hope someone enjoys building and using these antennas. The plans are not theory: I've built and used all these.
2. If you reprint these, please do not edit them down to a smaller size: I believe I've limited myself to a common information that cannot be substantially reduced.
3. Please do not remove my name from the articles: if there are problems/complaints I want to hear about them.
4. NOTE: I DO NOT claim to have invented/designed these! I have researched these designs at length and reduced the crutial construction information to a easily digested article.
5. There are other ways to build each of these. I only claim to have, by dint of research and experimentation to have hit upon a doable method. Experience with members of the Williamson County ARC (where I was in TX before I came to Atlanta and HP) proves that each of these antennas can be easily built and effectively used. If there are any gottchas, it is that the tv twin-lead j-pole must be carefully trimmed to tune; otherwise it is so-so.

916. Multiband Wire Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 18:08:07 UTC
From: edh@hpuerca.atl.hp.com
Message-ID: <C5HJpK.3KD@hpuerca.atl.hp.com>
Source record: 283136

Multiband Wire Antennas
By Ed Humphries - N5RCK

The March 1991 issue of CQ Amateur Radio contained yet another discussion of multiband wire antennas. In his column "Radio FUNdamentals", Bill Orr, W6SAI writes about the original W9CXX multibander with its' complex copper tubing matching section. He then goes on to discuss the popular G5RV developed by R. Varney, which is widely built and commercially available. Orr points out the deficiencies of the G5RV: when built in the original design it delivers reasonable SWR on the 7, 14, and 24 MHz bands, but into a 75 ohm coax feedline that is awkward to load up on modern transceivers; when built with 50 ohm coax the SWR is poor on all bands, but it performs reasonably well when used with a "transmatch" antenna tuner.

The column skips over an intermediate antenna design discussed in the March 1986 issue of Ham Radio. Bill's column back then pointed out that W5ANB first proved you could successfully modify the G5RV, load it with 50 ohm coax and run without any antenna tuner. But the best design (so far HI) he discusses in both articles is the one by ZS6BKV. Brian Austin used computer modeling to help him design a 5 band tuner-less antenna. Orr's CQ column reprints the design using only the dimensions for a 300 ohm matching section (I presume TV flat lead qualifies). In his original column Orr also presented the figures for using 400 (handmade open-wire leads) or 450 ohm (ladder-line) as the matching section. Since 450 ohm ladder-line is somewhat stronger than the commonly available 300 ohm TV lead-in, I'm here giving both sets of figures so you can make your own choice.

```
< 90' 3" for 450 ohm matching section or 92' 2" for 300 ohm >
o----------------------------oo----------------------------o
||
The ZS6BKV Antenna ||
||
|| 40' for 450 ohm
||
|| 36' 9" for 300 ohm
||
||
```

At the end of the matching section Orr recommends a 1:1 balun; others would say that several loops of coax at the feedpoint will do as well to help keep rf off the feedline. The feedline

to the transceiver is common 50 ohm coax; RG 58/U is fine for hf for most runs. This antenna should give low SWR on 7, 14, 18, and 24 MHz bands. At 28 MHz the SWR is really only good from 28.5 to 29.0. Tests showed the best SWR curves when the antenna was erected at about 42 feet above ground. When run as an inverted-V (90 degree) the resonant frequency came down 80 kHz for 14 MHz and 125 kHz for 24 and 28 MHz. The March '86 article printed SWR curves, and the March '91 article printed field patterns for all 5 covered bands.

917. Copper Tube J-Pole

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 18:13:37 UTC
From: edh@hpuerca.atl.hp.com
Message-ID: <C5HJyq.3su@hpuerca.atl.hp.com>
Source record: 283137

The Copper Tube J-pole
by Ed Humphries - N5RCK

The following is a description of a J-Pole antenna made from copper pipe. You can use 1/2 inch to 1 inch pipe (wall thickness will affect stiffness/stability AND price, but not performance). Larger diameter pipe increases bandwidth, but 1/2 inch is fine for amateur frequencies. Start with a 10 foot (standard) length of pipe, 1 90 degree (right angle) fitting, 1 "tee" fitting, 2 end-caps, 2 hose clamps (worm-gear adjustable of the appropriate diameter), and your coax (end stripped, braid separated, center conducter stripped, and coax sealant to close opening in coax to keep water out). Use a tube cutter (for best/easiest results) and cut the 10 foot pipe according to the dimensions needed following the diagram below:

```
__
| <=endcap
|
|
5/8 |
or |
1/2 |
wave |
|
|
|
-- | | <=endcap
| | 1/4
| | wave
| |
coax ctr conductor=>* *<= coax shield
| |
@ 5"-->| |
tee => --- <= elbow
|
| < "leftover" pipe
|
```

For best general purpose use, the 5/8th wave version should be used. The dimensions to cut are: 66 1/2 inches (5/8 + 1/4 matching section), 19 inches (other half of 1/4 matching section), 3/4 inch (joins the tee and the elbow), and the "leftover" 33 3/4 inchs that forms the base. Use standard plumbing solder methods to join main section to base using the tee. Use the 3/4 inch piece and the elbow to attach the 19 inch piece. Be careful to keep pieces parallel.

This will give you a center frequency of 146 MHz. Attach the coax as shown using the hose clamps. Adjust the swr at 146 MHz by sliding the connections up or down as needed -- you should be able to reach very close to 1:1 (best to do this in approximately where you intend to use the antenna - the base can be attached directly to a mast by two hose clamps). Try not to be standing right by the antenna!

It has been noted that this design can lead to rf coupling onto the feedline. To avoid this, put a ferrite on the coax at the feedpoint, or use 3 turns (@1") of the coax taped together at the feedpoint.

Other center freq dimensions: (adjust 5/8 section accordingly).
144 =19.25 inches, 145 =19.12, 146 =19, 147 =18.86, 148 =18.73.

918. TV Twin-lead J-pole

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-14 18:18:23 UTC
From: edh@hpuerca.atl.hp.com
Message-ID: <C5HK6o.45q@hpuerca.atl.hp.com>

A TV Twin-lead J-pole
by Ed Humphries - N5RCK

The following is a description of a J-Pole antenna made from 300 ohm
TV twin-lead. They have quite a few advantages which include improved
performance for 2-meter HTs, portability, and low cost.

```
| | do not short this end.
| | (when trimming for vswr, cut both sides)
| |
| |
| |
3/4 | | Technically-speaking, this is a 1/2
wave | | wave end-fed antenna with a 1/4 wave
| | matching section.
| |
| 1/4" gap
| | (trim for vswr _below_ gap)
| | 1/4
| | wave
| |
coax ctr conductor=>* *<= coax shield
1 1/4"-| |
-*- solder the twin leads together at bottom
```

For a center frequency of 146 MHz:
1. Start with @54" of TV twin lead (flat, NOT foam core)
2. Strip 1/2" of insulation at bottom and solder wires together.
3. Measure 1 1/4" from soldered wires and strip insulation on both
sides. This is the solder point for a coax feedline.
4. Measure 16 3/4" from coax shield solder point and cut out 1/4" notch.
5. Measure 50 1/3" from coax center conductor solder point and trim
off twin lead at that point.
6. Feed with a length of RG58U coax. Tape coax at feedpoint to the
twin lead for strength and seal coax for weather protection.

To get the best possible match, in step three above simply MARK the
"solder points" and measure from the mark for step 4 and 5. Now solder
straight pins to your conductor and your shield. Insert the pins at
the marked point and test for VSWR at the design frequency (146MHz).
If necessary, probe up or down till you reach 1:1 (close as possible).
Solder at the best points. To try this, you may want to start with
the twin lead a little long and trim down to resonant length - note:
you'll need to trim in a 3:1 ratio to maintain the 3/4 to 1/4 wave.

It has been noted that this design can lead to rf coupling onto the feedline. To avoid, put ferrite beads on the coax at the feedpoint, or use 3-5 turns of coax (1"-2") taped together at the feedpoint.

You may attach an alligator clip to the plastic on the top of the antenna in order to easily hang it. Alternately, punch a hole near the top and use a length of fishing line to hang.

This design appears on many BBSs, in club newsletters, and in books; the earliest reference that I know of is a Jan. 1984 D.A.R.C. antenna article by James Burks, KA5QYV. This antenna is relatively broad-banded and will be more than adequate if simply built as noted in steps above.

FYI, the 1/4 wave sections for other center frequencies are:
144 MHz =17 inches, 145 =16.88, 146 =16.75, 147 =16.65, 148 =16.54

I usually just go ahead and solder the coax in place and trim down to as close to 1:1 vswr as I can get. I use the MFJ vhf antenna analyzer and a frequency counter then afterwards test with a radio and in-line swr/power meter. When done, the antenna should also present 1:1.2-3 vswr in the center of 444MHz band as well (demonstrated on my dual-band meter and Alinco DJ-580).

For MS DOS, Autoexam by Rich Bono (NM1D?) is a nice piece of shareware.
It does exactly what you are looking for. I think the question pools
are also available from various places.

Download AUTOEXAM.ZIP and use pkunzip or a similar program to unpack it.
It comes with the question pools & documentation. The only thing
you will need is a copy of the ARRL "Now You're Talking" or W5YI's book
to get the figures. AUTOEXAM doesn't have any graphics. When the
question involves a diagram, the Figure number is given, so you can
look it up in N.Y.T.

The zip file also includes AUTOCW, which will run CW practice in various
modes.

Good luck... Hope you pass the test soon!

73,

Jim Morgan WX4D/3
jvm@aluxpo.att.com

PS: almost forgot: AUTOEXAM.ZIP can be downloaded from various places, one of which is wuarchive.wustl.edu (pub/hamradio directory I think). Another way to get it is via KA6ETB's mail server. Send mail to HAM-server@grafex.Cupertino.CA.US and include the line:
get /hamradio/exams/AUTOEXAM.ZIP uue

You will receive mail with AUTOEXAM.ZIP uuencoded. You can specify "xxe" instead of "uue" for encoding with xxencode instead of uuencode. You have to use some kind of encoding to send binary files through the mail.

The word INDEX on a separate line will cause the server to send you an index of all the files he has available.

Good luck & 73 de WX4D

|>
|> -Ron

Actually, I did this the other night. I get NASA select directly from F2/13 and brought up the WA3NAN on the HF rig and was surprised that there was NO delay. This would seem to indicate that WA3NAN was getting their feed from the NASA Select transponder, or from some other satellite (1 hop) hookup. There would be a quarter second or so of delay otherwise (which IS REALLY noticable).

Currently purchasable IRCs are supposed to be honored anywhere the international postal body (I can't remember the precise name) has agreements. I have used single IRCs of this new type to many countries. They say explicitly (In several languages) that they are good for a unit of AIR MAIL from any country which honors the agreements. DX stations should not need 2 or 3 IRCs of the new type from ANY country that takes IRCs for postage.

Chassis punches are made by Greenlee (expensive) and others (more reasonable). The cheap ones should work fine if you only need to make an occasional hole.

I bought mine at the local electronics supply house. (They had to order them.) I expect any decent tool store could get them as well.

I got a 25 watt Mobile rig (Ranger RCI-2950) last Christmas and have been having fun making contacts all over the world on 10m.

Talking to New Zealand on your way home from work is a real kick. Now that doesn't happen every day but I've chatted with the central and South America quite often and the carribean islands are common.

Yea, 10m looks dead today (flux < 90) but it comes and goes.

From: Cecil_A_Moore@ccm.hf.intel.com

Charles, it's going to be hard to do what you want to do with an HT unless
it is already built in (I don't know of any). But it would be relatively
easy to do with something like a Ramsey FX or ICOM-22S transceiver (mobil
or fixed). Use a microcomputer, like an 80C51, and let the
computer control the diode matrix input for frequency selection AND also
output the desired information to an alpha-numeric display or a PC. I am
working on just such a system using an ICOM-22S. There are public domain
assemblers and debuggers available for the 80C51 and the instruction set
is easy to learn...KG7BK

929. Looking for TV Xmiter info

Hello there!

I am looking for info/prices on small short-range TV transmitters.
The requirements are as follows:
Should accept BBaudio/video or RF3
Should be able to xmit in a radius of 0.75Km MAXimum
Should be able to xmit on RF2-RF4.
Must not have applicable export restrictions.
(would be nice if its not too big or too heavy).

This xmitter will be used (if obtained) will be used in a very hilly area
in another country. We expect to receive programming from their govt. sat
feed and re-broadcast over-the-air to the town.

Information/Ideas anyone? Thanks.

>Nice try though, but you haven't thought it through very well, now have
>you?

No -- I'm not an ARRL member. As a public membership organization, however,
I would assume that there are certain rights of private ownership bestowed upon
the "member owners" or some assemblance thereof. I would sincerely doubt
that the ownership status of QST is simply something akin to socialism where
it is free public domain. Advertising dollars are accepted from various
vendors, and the decision of what ads go in and what do not must rest somewhere.
Otherwise that would establish a precedent for the inability of the ARRL to
prevent ads from appearing in QST. As an extreme hypothetical example, if some
KKK Amateur Radio Society wanted to publish an ad for their organization --
which happens to advocate mutual on-air chatter about the extermination of
blacks, what Hitler failed to complete with the Jews, etc. -- then QST would
be powerless to prevent it.

I'm no ARL member and I'm no lawyer (but I play one on TV), but I also don't
see that as the case.

But you need to keep in mind that many countries, letters to some
places take more than "one unit". An IRC at a US Post Office will
get you $0.50 postage, which is enough to send 1/2 oz anywhere in
the world. However, some other countries do the equivalent of giving
you the air mail postage to Canada or Mexico (which I think is about
40 cents), and this is *not* enough to reach anyplace. Also, 1/2 oz
is very generous by worldwide postal standards. In many countries,
the weight limit for "one unit" of air mail postage is much less
than this - enough for an envelope and one card, but not for 3 or
4 cards. So it may well be the truth when that DX station says
one IRC is not sufficient.

Lastly, *any* IRC issued within the last few years (10?) is now
good for *air mail*, whether it says "air mail" or "surface". The
International Postal Union upgraded *all* IRCs to air mail. However,
the postal officials in out of the way places may not have heard
this yet, and may refuse to give your correspondent the correct
postage in exchange for a "surface" IRC.

As VE's, no. As indicators of how well amateur radio represents the general
population, yes. If women were well represented among hams, a randomly chosen
VE panel would probably have a few women in it.

From: tkelso@afit.af.mil
Message-ID: <tkelso.734838379@afit.af.mil>
Source record: 283155

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

I agree with Jon. However the final proposal ends up, it should include
r.r.a.tech. If construction gets to be a big enough sub-group in later
years we can revisit it, but I'd like to see construction included in
tech.

WEST VIRGINIA HIGH ALTITUDE BALLOON LAUNCH

A high altitude balloon carrying three separate amateur radio
transmitters is set to be launched from West Virginia Saturday morning,
April 17. Unfavorable weather will cause rescheduling to the following
day. Persons are invited to listen in to the launch and flight-time
HF net on 7.155 MHz. Comments and inquiries can be made on this frequency
before the launch.

Launch Site: Tri-State Airport, Huntington, West Virginia
Time and Date: 9:00 AM EDT, Saturday, April 17
Bad Weather Alternate T/D: 9:00 AM EDT, Sunday, April 18
Launch HF Net: 7.155 MHz SSB

Approximate Flight Duration: 2 hours
Maximum Expected Altitude: 100,000 feet
Range Of Signals At Max. Altitude: as much as 400 miles

AIRBORNE RADIO SPECIFICATIONS

144.340 MHz FM, 1.5 watts --- audio-tone temp. telemetry

28.800 MHz AM, 50 milliwatts --- 4 channel keyed audio telemetry
147.450 MHz FM, 5 milliwatts --- (same as above)

This is a project sponsored by KB8KMA, WA4GSS, and the River Cities
Amateur Radio Club. Technical assistance by WB8ELK. Foregoing information
courtesy of Ron Curry, WA4GSS.

I'm after some notes/examples/schematics etc. of a full-duplex microwave system with a bandwidth of around 5MHz to 10MHz, especially if the tx/rx element is a Gunn diode. Pointers to back issues of Australian, US or UK magazines etc. would be good.

Many thanks,

Warren vk1xwt (wkt@csadfa.cs.adfa.oz.au)

I think I understand your point now - you want to establish something that is, by its name, a magnet for new users. For that purpose, I can see why you don't like "education". The new rec.aviation hierarchy has rec.aviation.student but that works better there than here because they use the term "student pilot" for their trainees.

But I'm not sure that r.r.a.instruction fails to function as a new-user magnet and imply that new users can ask questions there.

Everyone - with this clarification of what Jon is suggesting, what do you think? Does r.r.a.instruction sufficiently imply that new users should go there or is r.r.a.beginner the only way to accomplish this? Help with more perceptions here can make this a better proposal.

>matters, I think they should go together in a newsgroup.

Almost everything in amateur radio is a subset of technical discussions.

The need for this doesn't seem as clear. I agree with the earlier point that newbies have trouble focusing their questions. So r.r.a.beginner may be a good place for unfocused discussion. But we're not trying to make more unfocused discussion groups.

Whether they're called r.r.a.homebrew/construction, r.r.a.equipment/products or r.r.a.instruction/beginner, their names imply both their charters and their differences from the others. r.r.a.technical does not appear to differentiate itself from r.r.a.misc because they're both grab-bags in a technical subject. The solution isn't ideal but the most logical place to put the leftovers from these proposals seems to me to be r.r.a.misc. If our efforts succeed, that won't be such a bad place any more anyway.

[My opinion aside... I'm watching the discussion for others' reactions. This is still listed as an open issue.]

942. 9913 Equivalent Water Trouble

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 03:58:45 UTC
From: jcox@lakes.trenton.sc.us
Message-ID: <m1q12B1w165w@lakes.trenton.sc.us>
Source record: 283167

I am using a 9913 equivalent feedline to my V2S omni at 85 feet. The feedline comes down the tower (taped to the legs), then into a 2" PVC underground conduit to the shack. PL-259 connectors are installed at both ends. The V2S end is weatherproofed with the putty-type sealer and is inside the V2S mast. This setup has been in service a couple of years.

The other day, I disconnected the feedline in the shack due to an impending storm. When I went to reconnect it the next day, the connector was oozing water! The SWR had gone from essentially flat to 10:1. I have since cut the connector off in the shack, and sucked out about two tablespoons of water. Each day, though, it continues to ooze a thimble full of water or so.

I hope to be able to fold the tower, cut off the connector, and pull air through the line with a shop vac to dry it out for reuse. My question is are there others who have had similar problems with the "air core" type lines and is there a preferred method of connector installation (sealing, etc) that works better than others. I realize this may be due to condensation over time (awfully muggy summers in SC). Also, are there any water leakage problems with HyGain V2S users?

Thanks and 73, John WD4PKZ/AFA2TS (USAF MARS)

I really wonder if we can successfully create such a forum for newcomers. The news.newusers.questions ghetto sticks out in my mind as an example of wasted space where the same questions are asked over and over. There is a finite, and predictable, amount of information to get across to novices, and duplicating information that can be found in FAQ's and FTP archives may not be desirable.

Usenet just may not be the best forum for tutoring beginners. Beginning-level instruction and guidance may be best offered at the local, one-on-one level, or privately via E-mail (hence my efforts with the Elmers List). Remember also, that you need friendly and motivated people to continually answer the same questions over and over and provide polite mentoring. I suspect that the amount of noise in such a proposed forum will cause the knowledgeable readers to quickly tune it out and turn it into a case of "the blind leading the blind."

I like r.r.a.instruction because, as I noted on the rra-reorg mailing list before the RFD, it implies ongoing instruction for hams of all expertise levels. (A newsgroup like rec.radio.amateur.beginner reminds me of that scene out of Animal House where the undesirable pledges at a snobby fraternity's rush party are not-so-subtly nudged over to a "loser's corner" :-). Count me as voting no for exclusive ghettos for newbies, and

yes for inclusive forums accommodating a wide range of expertise levels.

Put me down also as taking a liking to rec.radio.amateur.dcom.*
over .digital.*, as it's consistent with comp.dcom.*. However, I'm
favorably disposed to either. Any other opinions either way?

Wow, I hope you're being sarcastic. If not, you should join all the
no-codes screaming for HF access because if you opened up the lower end
of 10m to the CB'ers, the no-code bozos would definitely go balistic!

What happens when DVC (Digital Videon Compression) is introduced next
year and instead of just receiving squiggly lines on 2 or 3 channels
we'll be receiving sqigglies on, let's see 3*10 = 30 channels eventually.

Actually, most cable systems will still reserve channels 2 through 30 for
analog (the current system) and 31 on up will be digital. When they all
go digital I'll go to DBS or those 27.5-29.5 GHz square dishes I've heard
about (CellularVision).

Hmmm.. does this sounds suspciously like our FCC here in the states
where jammers pretty much get away with anything because they've taken
most of the bite out of enforcement. {sigh}

Does somebody know where I might be able to ftp a list of all radio frequencies used in the U.S.? In particular, I am interested in a list which gives the frequency and then what it is used for. If there is no "known" use for a given frequency, then I would like to see what that frequency is hypothesized to carry. I use the term "radio" lightly. Essentially, I am after a list which would give all usable frequencies, from VVVVLF to VVVVHF (very,very,very,very low/high freq.) If no such thing is available via ftp then maybe someone could recommend some other references. Any info appreciated, and e-mailed info is appreciated even more. Thank you.

952. Re: 9913 Equivalent Water Trouble

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 06:57:49 UTC
From: zlau@arrl.org
Message-ID: <1380@arrl.org>
Source record: 283194

As I posted earlier, I don't think that sealing air dielectric
cable is a feasible way of keeping water out. The water enters
as a gas and condenses whenever the dew point gets low enough.
The commercial solution of pumping dry air though the coax is
a bit impractical, so I've devised two other solutions :-).

The first is to run enough power often enough to keep the coax
warm and above the dew point :-). However, I don't think this
is adequate reason for running 1500 watts :-). Installing a
heater around the coax is less practical than the broadcasters'
solution.

The second is to only use it on vertical runs, and install a
special T joint at the bottom that allows water to leak out.

My personal solution is to avoid this type of cable, and use
either copper jacketed Hardline/semi-rigid or RG-213/U instead.
I think the aggravation factor is just too high for its
benefits.

ZCZC AG76
QST DE W1AW
ARRL BULLETIN 35 ARLB035
FROM ARRL HEADQUARTERS
NEWINGTON CT APRIL 2, 1993
TO ALL RADIO AMATEURS

SB QST ARL ARLB035
ARLB035 ARRL SUPPORTS FINES

ARRL SUPPORTS FCC FINES

THE ARRL HAS FILED A MOTION TO SUPPORT THE FCC IN A LAWSUIT FILED
BY BROADCASTERS WHO SEEK TO OVERTURN THE WAY THE FCC ENFORCES
INDECENT BROADCAST PROHIBITIONS THROUGH FINANCIAL PENALTIES. ARRL
SAYS THAT A DECISION IN FAVOR OF THE BROADCASTERS COULD HARM THE
FCC'S ABILITY TO COMBAT INDECENCY ON AMATEUR RADIO FREQUENCIES.

IN A MOTION FILED IN UNITED STATES DISTRICT COURT FOR THE DISTRICT
OF COLUMBIA ON MARCH 16, ARRL ASKED TO PARTICIPATE IN A SUIT
BROUGHT BY ACTION FOR CHILDREN'S TELEVISION AND 20 OTHER
BROADCASTING AND PUBLIC-INTEREST ORGANIZATIONS. THE BROADCASTERS
ALLEGE THAT MONETARY FORFEITURE PROCEEDINGS USED BY THE FCC IN
INDECENCY CASES VIOLATE CONSTITUTIONAL DUE-PROCESS AND FREE-SPEECH
PROTECTIONS.

SINCE PROMPT JUDICIAL REVIEW OF FORFEITURE ORDERS IS NOT AVAILABLE,
THE BROADCASTERS SAY, THEY MUST ENGAGE IN SELF ACENSORSHIP. THEY
IMPLY THAT THE FCC HAS USED THE PROCESS TO PUNISH OR THREATEN THEM
IN VIOLATION OF THE COMMUNICATIONS ACT OF 1934. THE BROADCASTERS
HAVE ASKED THE COURT TO PROHIBIT THE PROCEDURES NOW USED BY THE FCC
TO RULE ON ALLEGED INDECENCY VIOLATIONS UNDER 18 U.S.C. 1464, TO
ENJOIN THE FCC FROM INITIATING OR CONDUCTING FORFEITURE PROCEEDINGS
UNDER 47 U.S.C. 503(B) FOR ALLEGED VIOLATION UNDER 18 U.S.C. 1464
AND TO ORDER THE DISMISSAL OF ALL INDECENCY FORFEITURE PROCEEDINGS
UNDER 47 U.S.C. 503(B) CURRENTLY PENDING BEFORE THE COMMISSION.

''WHILE THE RELIEF SOUGHT BY THE PLAINTIFFS SPECIFICALLY CONCERNS
THE BROADCASTING SERVICE,'' SAYS ARRL PRESIDENT GEORGE WILSON,
W4OYI, ''WE'RE CONCERNED THAT IT MIGHT HAVE THE EFFECT OF
```

HARMING FCC EFFORTS TO ENFORCE RULES IN THE AMATEUR SERVICE THAT HAVE BEEN STRONGLY SUPPORTED BY RADIO AMATEURS.''

ARRL HAS REQUESTED TO BE PERMITTED EITHER TO INTERVENE IN SUPPORT OF THE FCC OR, ALTERNATIVELY, TO SUBMIT A BRIEF AMICUS CURIAE IN SUPPORT OF THE INTERESTS OF RADIO AMATEURS.

European prices are indeed often very much greater. To buy from the USA, just phone or fax quoting your access/visa/whatever card number to pay. You will need to pay shipping ($100 for a rig or therabouts) plus any local taxes and VAT. The tax rate to the UK would be about 30%, so you may save yourself $200 in all. If you are buying a new rig, it may be cheaper to get a cheap flight to Florida or new york, buy the rig and bring it back, paying duty on arrival of course. I worked out that to get a TS450SAT I could have a free holiday (staying with friends) with the money saved over the UK price. Then a company called Radio Shopper appeared, they are a grey importer and make no secret of the fact. Their prices are better than anyone else even after our devaluation. As Holland are not worth 25% less like the UK, you can probably contact them and ship UK-PA very cheaply.

Mike

955. Sending DX info to the OPDXB

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 10:53:48 UTC
From: aq474@cleveland.Freenet.Edu
Message-ID: <9304151053.AA13913@slc4.INS.CWRU.Edu>

Fellow DXer's,
The Ohio/Penn DX Cluster Group and myself would like to thank
all of the DXer's world-wide for the great response to the OPDX
Bulletin. Most of the bulletin's information is supplied by the
Ohio/Penn Group. But now, with the continuing input from both
foreign and stateside, the OPDX Bulletin will grow bigger and
better as time goes on. With the technology of packet radio and
the DX PacketCluster the information that is available can be
very current.

If you would like to contribute DX information, (All contributors
will receive credit), send it to:
Packet Mail - KB8NW @ WA8BXN.OH.USA.NA
InterNet Mail - aq474@cleveland.freenet.edu
BitNet Mail - aq474%cleveland.freenet.cunyvm
PRODIGY - DFJH48A
Online Mail - Basic Amateur Radio Frequency BBS (BARF-80)
216-237-8208 14400/9600/4800/2400/1200/300 8/N/1
Leave a message with the SysOp
NOW FAX YOUR DX INFORMATION! Faxing is available Monday/Wednesday/Friday
from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3
FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times
specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by
leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing
the same phone line as BARF-80 BBS using a data/fax/phone switch.

73's and Good DX de Tedd KB8NW @ WA8BXN.OH.USA.NA

The following is a list of informational files for this newsgroup
available via anonymous FTP from ftp.cs.buffalo.edu (currently at IP
number 128.205.32.9).

Questions to bowen@cs.buffalo.edu

1750m.band - misc info on the 1750m band
ampr_coordinators - coordinators for packet IP addresses
antenna_refs - references for articles about antenna designs
arrl-logo.ps - ARRL logo in PostScript format
arrl_bib - bibliographies from ARRL literature (ASCII format)
arrl_digital_minutes - Minutes of the ARRL committee on digital comm.
arrl_fo_jobs - descriptions of some ARRL Field Organization jobs
arrl_info_service - announcement of the ARRLs trial information service
cal_pd_freq - California police frequencies
callbook.tar.Z - sources for the marvin callsign server v1.3
canadian.Z - Canadian ham database in FCC format
carpet.loop.2 - Antenna for apartments and small spaces
clubcalls.Z - database of US ham clubs
comb6.zip - HF Propagation Predication program
docket_91-36 - information regarding the proposed scanner regs
dxcc-k2di - ARRL DXCC country list
element_credit - rules about VE credit for earliers exams
elmers_admin - information about the elmers list (see below)
elmers_list - list of elmers on the network
exam_ops - info on exams and exam opportunities
faq_callsign - frequently asked questions about the callsign server
faq_ham_1 - frequently asked questions about ham radio (pts 1)
faq_ham_2 - frequently asked questions about ham radio (pts 2)
faq_ham_3 - frequently asked questions about ham radio (pts 3)
faq_packet - frequently asked questions about packet radio
faq_shortwave - frequently asked questions about shortwave
fft.com - EGA/VGA DOS command for spectral display (QST 1/92)
ffth.com - Hercules DOS command for spectral display (QST 1/92)
field_day_92 - field day rules for 1992
florida_antenna - Florida State antenna law info
guide2newsgroups - description of USENET newsgroups dedicated to radio
ham_sat_sum - summary of information needed to get on satellite
hams_on_usenet - list of ham operators and e-mail addresses on the net
hamstacks - information about the question pool stacks
handicap_waiver - info on obtaining a handicapped test waiver
```

hf_rigs - QST reviews of available HF rigs
ht_info - general information about commercial hand helds
intro_to_swl - info for aspiring short wave listeners
intro_to_scanners - info for aspiring scanner listeners
jlem.zip - Program, w/source, for 2kx8 ROM emulator, QEX 01/93
j-poles - description of j-pole antenna made from twin-lead
lead_acid_batteries - essay on lead-acid batteries
license_plates - guide to ham calls on license plates
logos - PostScript logos for various ham organizations
mail_order - a database of electronic mail order shops
manufacturers - names and addresses of ham gear manufacturers
motorola_ge_service_man - how to get service manuals for Motorola and GE rigs
new_packeteers - helpful essays for new packeteers
newcomers - tips and hints for those new to amateur radio
packet_clubs - organizations you can get more packet info from
packet_gateways - list of gateways from packet to Internet
packet_misc - miscellaneous packet info
packet_software - list of packet software versions
phone_bbs_list - phone BBSs for ham related issues/software
pio_handbook - ARRL Public Information Officer's Handbook
pr_docket_92-136 - text of FCC PR Docket 92-136
qsl_bureau1 - information about the ARRL QSL bureau
qsl_bureau2 - "what should I do if" list for the QSL bureau
qst_prodrev - index of ARRL product reviews in QST
repeater_map_proj - description of Electronic Repeater Mapping Project
rfi_tips - good posting about RFI
sol_geo_data - desciption of daily solar geophysical broadcasts
sol_terra_terms - glossary of solar-terrestrial terms
sstv_wefax_info - general help for SSTV and WEFAX users
usenet_purchases - tips on buying and selling via USENET

For readers of this newsgroup both new and experienced, these files are
a de-facto "Required Reading List" to provide definitive answers and
pointers to other sources for questions that come up in this forum.

This is also your archive, so any additional articles, guides, or small
PostScript graphics that you feel would enhance this collection are most
welcome. Submit to Devon via his E-mail address above.

Thanks go to Devon Bowen, KA2NRC, for providing diskspace and maintaining
these valuable archives, as well as all the authors who wrote and submitted
the information contained in them.

Additional archives out there that have /pub/ham-radio directories are
encouraged to "mirror" these files to provide redundant storage for these
documents. Some of these sites (which may or may not mirror

Questions about FTP mirroring and access to appropriate software should
be directed to me, or do an Archie search on the keyword "mirror."

For those without FTP access (and only those without FTP access,
please), there is an FTP mail server at ftpmail@decwrl.dec.com (IP

16.1.0.1). Send the word "HELP" to this address for more information.

Additional documents on Usenet and other newsgroups may be obtained from pit-manager.mit.edu (IP 18.172.1.127) via anonymous FTP or via mail server (send the word "HELP" to mail-server@pit-manager.mit.edu).

The American Radio Relay League has recently made available a mail-server to distribute many of their informational documents in electronic form. Send E-mail to info@arrl.org with "HELP" in the message body for more information.

Yet another mail-server has been made available by Steve Harding, KA6ETB. Send E-mail to ham-server@grafex.Cupertino.CA.US with "HELP" in the message body for more information.

Revision: 1.3 03/31/93 23:32:39
Changes: Added description of rec.radio.info

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 27 January
1993.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to
a mailing list, thus avoiding problems.
```

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

The Current Groups
==================

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.packet is for discussions related to (surprise!) packet radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules,

regulations, legalities, and policies that surround amateur radio, both existing and proposed. The never-ending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar propagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available by electronic mail; the gateway that was formerly available for posting at ucbvax.berkeley.edu has been shut down for all but users at UC Berkeley.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present

the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

There is a chapter in the ARRL Antenna Book that has a lengthy formula
for recalculating dimensions because of substitution of a different diameter
wire. Does anyone know of any software, available via ftp, that will do these
calculations?

Thanks.

>microhpones.

>Thanks in advance.

Get the model that has an amplifier in the base. Otherwise, on most
of them, you will have to turn the mic gain up most of the way with
an increase in hum/noise. You will find several of them for sale
at most larger hamfests. Price is usually $25-$40. K9ALD

960. Smith Chart - where?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 14:21:31 UTC
From: ts74113@cs.tut.fi
Message-ID: <TS74113.93Apr15162131@kaarne.cs.tut.fi>
Source record: 283172

Hello,

I think there was an article on the net some time ago that there is
the Smith Chart as PostScript file somewhere acceptable by anonymous
ftp. Does anyone know what is the site name? It would also be nice if
there was Smith Chart on some convertable graphics format -
preferrably vector graphics.

Thanks,

Timo, oh3yn

I think it's great that there are Callsign servers out there in Internet-land.

Is there a Repeater server? Or, is there an FTP-able file with repeater listings? I'm interested in 2-meters in general.

Mark,
I have the 736R also, but don't waste your time with the CAT interface.
There is no way of getting status (i.e. freq and mode) back from the radio,
which makes having the interface almost useless. That is the reason you
don't see any software for the 736R.

963. Equipment for a shuttle contact?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 15:47:23 UTC
From: cvm@nauvax.ucc.nau.edu
Message-ID: <930415154723@nauvax.ucc.nau.edu>
Source record: 283210

I posted a similar question earlier and got no response so I'll try
again.

What equipment is necessary to make a contact with the space shuttle or
to even hear it?

I have been trying to at least hear them for the entire STS-56 mission
without success. I have tried listening from my mobile 2 meter with a
5/8 wave antenna on my car and I have tried the same radio in my house
with a 5/8 wave j-pole on the roof. The j-pole feed line is about 50
feet of RG-8. I have even tried listening at the same time with my HT
and an AEA Hot Rod (1/2 wave). I have not heard anything, voice or
packet. I have been using a couple of different statellite orbit
prediction programs to know when to listen.

This seems like a reasonable setup to me to at least listen. I have
thought that perhaps the signal is be so weak that it is lost
on the 50' of feed line and not strong enough for my radio to pickup.
In that case I would probably need a preamp at the antenna feed point.
Also, it seems that the position of the shuttle antenna would need to be
favorable during the current pass for me to hear it.

If you have heard the shuttle or made a contact could you let me know
what equipment you used? Thanks for any help you can give.

The only way to avoide the taxes is to be associated with a US military or
diplomatic service. When I was in Europe I ordered many things from
Amateur Electronic Supply (AES), but they were all shipped to APO
(military) addresses.

:
: From: Cecil_A_Moore@ccm.hf.intel.com
:
: Charles, it's going to be hard to do what you want to do with an HT unless
: it is already built in (I don't know of any). But it would be relatively
: easy to do with something like a Ramsey FX or ICOM-22S transceiver (mobil
: or fixed). Use a microcomputer, like an 80C51, and let the
: computer control the diode matrix input for frequency selection AND also
: output the desired information to an alpha-numeric display or a PC. I am
: working on just such a system using an ICOM-22S. There are public domain
: assemblers and debuggers available for the 80C51 and the instruction set
: is easy to learn...KG7BK
Sorry I missed the first post but...
My girlfriends new Kenwood TH78-A (Which was the first, and last thing
I have or will purchase from Oakland HRO, but that's another thread. :-)) Does
have an Alpha-Numeric display option for the memories. The advantage is obvious
but it does cut the available memories from 50 to 25 total and I thing there are
only 7 or 8 digits in the display. It also has the option of not displaying the

frequency at all and just showing a channel number.
The TH-78A also has a really interesting clone feature. We only has one but I am
considering trying to record the DTMF codes off the air and see if I can use it
as a back-up for her memory. This is only neccesary because it is very easy to
erase the memories when putting the radio into game mode. :-)
BTW one of the club members brought a service monitor to the last meeting and
she had the hottest reciever in the club. :-)
good luck and 73

I agree with this; I don't think there are many folks in the r.r.a.m. group who are magnanimous enough to read the beginner group and answer the same questions over and over and over again (except those who specifically enrolled themselves in the elmers list); then the hapless beginner would be forced to post to r.r.a.m., inviting flames. No, I think that beginner questions are best addressed in the FAQ as we and most other groups do now, and I will vote "no" for a r.r.a.beginner group.

I'm not familiar with the comp.dcom.* hierarchy, and just looking at the nonword "dcom" doesn't give me a feel for what this group would be about. I prefer "digital", as this word has a definite meaning and is in fact a broader topic, encompassing both digital communications modes and things that are not so obviously communication, i.e., packet telemetry or other digital control/status signals.

Stan I don't think it is recommended or required. I've had mine up for four
years here in Oklahoma and it has with-stood winds in excess of 90 mph with
no apparent damage. The TH7DXX at the same site appears just as durable.

I wouldn't consider additional guying for either one.

>>The cb radios I've come across in the local stores seemed very reasonably
>>priced. Where do find info on that sort of stuff? Anyone out there on the net

>>has done the conversions before?

I would write to Lou Franklin and get one of his catalogues. He
advertises in the ham magazines with an ad that has a "CB TO 10 METERS"
banner. He sells books on how to modify CBs, as well as comprehensive
lists of which CBs can be modified and which cannot.

On older crystal-synthesized CBs, it is simply a matter of changing
the crystals and doing some simple re-tuning. I have a Cobra 148
23-channel crystal-synthesized rig that was converted to 10 meters
just by changing 4 crystals and performing a modification that
allows for the "clarifier" knob to change the transmit frequency.
The rig works great on 10m ... 10 watts out on SSB, which is fine
for mobile work when the band is open. It covers 28.290 to
28.520 MHz.

Some modern PLL CBs can be modified and some cannot. Again, I would
suggest getting the list sold by Lou Franklin.

975. An Experiment : Vertical vs. Horizontal

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 18:31:37 UTC
From: rossi@VFL.Paramax.COM
Message-ID: <1993Apr15.183137.19181@VFL.Paramax.COM>
Source record: 283192

I ran an little experiment over the past few days comparing a 1/2 wave vertical dipole to a 1/2 wave horizontal dipole on 20 meters.

Thought some readers might be interested in the results.

For the past 2 years or so, on 20 meters I have been using a simple 1/2 wave (33 feet) horizontal dipole stretched between the house and a tree - running basically north/south. It is about 17-18 feet above the ground (roughly 1/4 wavelength). It is fed with coax. The SWR runs virtually 1:1 at 14.000 and rises to about 1.3:1 at 14.350. I do not use a tuner. It works basically "so-so". I have not been terribly active but when I get on 20 I usually could work almost anything I want to -- except the real monster pileups are kind of rough.

I started wondering how a vertical dipole at similar height would compare. The patterns shown in the books seem to imply that it should be better. So last weekend I put up a 33 foot vertical dipole. The antenna consists of a 16 1/2 foot piece of aluminum tubing on top of a 18 foot wooden mast. A piece of heavy wire about 16 1/2 feet long extends down the side of the wooden mast to form the other half of the dipole. The center of the coax is connected to the bottom of the tubing and the shield to the top of the lower wire half. The coax runs off at about a 45 degree angle before reaching the ground about 25 feet from the mast. It then runs on the ground an additional 40-50 feet to the basement window. The bottom of the lower wire is about a foot above the ground. SWR runs about 1.4:1 at 14.000, dips to about 1.2:1 at 14.200, and the is back up about 1.3:1 at 14.350. Again, I am not using a tuner.

- - -

So far results have been very encouraging. As expected, the noise level is about 1/2 "S unit" higher on the vertical dipole than the horizontal but THE SIGNALS ARE STRONGER TOO! The band sounds "hotter" with the vertical dipole.

Generally, signals on the vertical dipole seem run about 3-4 "S units" stronger than the horizontal dipole. A few have been a much as 5-6 "S units" stronger! Very few signals are stronger on the horizontal dipole and then only by maybe 1 "S unit" or so.

I have been working stuff with no problem with the vertical dipole and a few comparison reception reports indicate the same approximate 3-4 "S unit" improvement over the horizontal dipole.

I hope conditions on 20 improve. I am anxious to run some more tests.

- - -

I sort of expected the vertical dipole to be a bit better than the horizontal dipole but I wanted to actually see it for myself and by just how much. Now I am considering taking down the horizontal dipole.

This vertical dipole was fairly easy to construct. Anyone who can't get a horizontal dipole up much more than 1/4 wavelength high my want to try putting it vertical instead. It should do better.

I suppose there are a million ways one could construct a vertical dipole such as this. I just used supports and materials that happened to be available.

Send e-mail if you want additional info/suggestions or have any comments.

From: zardoz@ornews.intel.com
Message-ID: <1qka7d$3dq@ornews.intel.com>
Source record: 283193

The other nite I was involved in a ragchew roundtable with a bunch
on 223.50 Mhz (simplex). A fella came on who said he was working
off a mountaintop about 100 miles south of us and he had been
participating in a 220 Mhz SSB contest of some sort. He had
decided to check FM because SSB was pretty slow.
This got us to talking about 220 SSB and what to use for gear.
Is there a 220 SSB rig all set to go that I can buy if I want?
Who makes transverters (other than Hamtronics)? How much 220 SSB
activity is there? What really got me was that I had just made
a remark to the others about no 220 SSB activity when on comes
this guy who says he's been doing it, or at least trying.
This has happened to me before. I was showing a new ham how to
work an old Hammarlund HQ-110 that I had found for him and he
asked me about the 6 meter band position. "Oh, there's never
anything on there", I said as I flipped the bandswitch over to 6.
The band was alive with SSB activity, of course.

>> MFJ loop and the AEA isoloop. Any reccomendations ?

The MFJ loop is still vaporware. I am not sure if I am looking
forward to it. It is essential that a small transmitting loop
be well-constructed, but MFJ is not knows for its construction
quality.

I would recommend that you read the review of the AEA Isoloop
antenna in this month's 73 Magazine. (or it might me
CQ magazine) The author compares its performance to
a beam on 20m. He said that the beam provided better
signal reports (of course), but that any contact that he
made on the beam could also made on the loop. I own an
Isoloop, and I highly recommend it for anyone with space
limitations. (that's just about everybody these days) It
is easy to install and use. It also makes a fantastic receiving
antenna for 9.2 to 30 MHZ ... about the best receiving antenna
I've ever used. The only drawback is that it is a bit expensive.

There is no point to increasing its power to 50 watts. You will
get no better signal reports.

Since the digital transmission schemes include error correction and concealment, the performance remains about the same down to a very low carrier-to-noise ratio, below which it degrades very quickly. Hence, digitally compressed TV is supposed to be less susceptible to interference than amplitude modulated TV.

982. Tell me about "Electro-Bug" and old Vibroplex key

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 20:39:26 UTC
From: jbs@rti.rti.org
Message-ID: <1993Apr15.203926.775@rti.rti.org>
Source record: 283196

Over Easter weekend I was visiting relatives and was shown some old telegraph equipment that my great-grandfather used when he was a telegrapher for the railroad. Everything appeared to be in good mechanical condition, though in less than great cosmetic condition.
One was a black Vibroplex key with a gold nameplate, serial number pretty well unreadable. The action seemed to work fine. There was also a small wooden box which I think was printed with a Vibroplex logo; the key fit in it perfectly, so I assume that's what the key came packed in.
The other was a black send/receive key with a black and silver plate attached to it saying "Electro-Bug".

Is this equipment valuable, or is it dime-a-dozen sort of stuff?
They're not interested in selling it; I was just curious in case the stuff was valuable enough that they may want to make certain it's insured.
Any information will be appreciated.

In the ARRL Radio Handbook there is a table that shows the information you need. It is in chapter 39, and not indexed, unfortunately. It also shows the harmonics of each amateur band to help make clear what amateur radios can pontentially interfere with. For a more detailed list, go to the
government documents section at your library and look in the section pertaining to the FCC. They published a handbook of the entire US Frequency allocations. There are no empty spots.

>It should be particularly effective if you know a ham who is also a police
>officer and let him be the spokesman (in uniform if possible).
>

In Lancaster (California) we recently put a very active jammer out of business. Malicious interference had been traced repeatedly to a certain location where two young (12 and 15) hamsters live (we all suspected the older hamster, but it turned out to be the younger).

One evening, the home was staked out by a number of local hams. One of the local hams is a California Highway Patrolman; he was not staking the house out but had stopped by while on duty. One of the hams works for a Federal agency; he was able to bring a DF van (actually a motorhome) that gives DF bearings in 100 mS, and has a GPS driven computer map of the area. One of the hams is a recently retired government communications specialist; he's also a retired deputy sheriff reserve.

One the neighbors, seeing an ominous motorhome covered with strange antennas and radomes, called the cops. The deputy who showed immediately recognized the retired reserve, and they started catching up on the old times.

Imagine if you walked outside and found two cops and strange van full of serious-faced men. What would you do? Would you stop?

Well, the point is moot; the jammer is blind. However, his (hamster) brother described the scene to him, and the young jammer broke into tears. He thought he was going to jail. I don't know if an older/wiser jammer would have been as intimidated.

>Even old used punches would be a help.

Should be able to get them at most electronics supply places, like Newark or Mouser, or your own local places. Also check with local industrial tool supply places. Greenlee is a good brand. Another handy tool is a Whitney hand punch, for holes up to just over 1/4" for the "Jr." punch. There's a larger one (XX?) that goes to bigger holes and has a deeper throat, but the price is a bit steep. Though everyone calls them just "Whitney," I believe the company is Roper-Whitney. There are import knockoffs of these, but I haven't liked them as well.

I did a similar experiment last year. I lived in an apartment on the
third floor with scads of RFI. I had two antennas, a horizontal
magnetic loop on 20M, and a top-fed 20M half wave (ie, magnet wire
stretching from my window down to the ground). The vertical was 1-2 S
units better, and was no worse at rejecting near field noise.

991. 5/8 wave 15 meter antenna

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 22:19:47 UTC
From: jeffj@cbnewsm.cb.att.com
Message-ID: <1993Apr15.221947.3363@cbnewsm.cb.att.com>
Source record: 283212

I am using a G5RV on 15 meters right now and it is ok to say the least. Looking in a wire antenna book that I have they show how to make a 5/8 15 meter antenna. As 5/8 antennas are susposed to have 3 db of gain over a dipole it looks like a good way to go. I was wondering if anyone else has used 5/8 wave antennas on HF and what would the drawbacks be? I realize that it might be a bit noisier but getting almost a full S unit improvement would be nice to have as I work alot of 15 meters CW and SSB. Thanks for any and all help! 73!

Aaron-

I thought the same thing a couple of years ago, when the older
MR-101(plain) became available "used", also for $29 + P&H. I was wrong.

Today, the radio is nearly useless. Primary problem is bad switches.
Secondary problem is poor sensitivity, with images almost as strong as main
signals on the shortwave bands. (Strong images might be considered a
"feature", since they allow reception of frequencies outside the normal
limited range!) There are numerous tertiary problems related to poor
design and/or workmanship.

I suppose it is a $29 lesson we each have to learn for ourselves.

XDescription of smith.ps (Smith chart PostScript program)
X7 January 1991
XMarshall Jose, WA3VPZ
XJHU - Applied Physics Laboratory, Laurel, MD
X
XThe file "smith.ps" is a first-cut attempt at recreating within PostScript
Xthe chart invented by Phillip Smith of RCA which is of inestimable utility
Xto RF engineers. The most significant object on the chart is the reflection
Xcoefficient chart in the chart's center. This chart relates complex
Ximpedances (or admittances) to their resultant reflection coefficient.
XSee just about any introductory microwave text for further information.
X
XI reproduced the nomographs along the bottom as best as I could from the
X1966 original (Kay Electric Company #82-BSPR (9-66)), but I deleted some
Xnumerical labels to accommodate the font used; this shouldn't affect their
Xuse.
X
XAs I mention in the beginning comments, this program is for cheap
Xstudents and other not-for-profit individuals. Anybody incorporating
Xany part of this code into a commercial product is welcome to risk
Xtheir own legal neck, but leave me OUT of it.
X
XI confess I failed in my primary aim with this chart, namely to generate
```

```
Xa combined impedance-admittance chart with different colors on a color
XPostScript printer. Unfortunately, I was unable to get access to one,
Xso I gave up. Nevertheless, I do have a procedure "DoGB" which will
Xgenerate the admittance circles using dashed lines and a sparser grid.
XIf it is used it should be executed prior to the execution of "DoRX"
Xso that the impedance circles are drawn on top.
X
XI have tried to be fairly straightforward with the coding so that others
Xcould modify it without much grief. The brave souls who wouldst hack
Xthis code might find lots of places where the code could be optimized
Xfor speed; I encourage them. There are probably way more call to "sin"
Xor "atan" than are necessary, making the whole chart take about 60 seconds
Xto print out on a LaserWriter II NTX. Your mileage may vary.
X
XThe casual observer will notice that smith.ps does NOT adhere to
XEncapsulated PostScript Format (EPSF). This is probably a bummer
Xif you wanted to use this in a document. Anybody knowing how to
Xput it in EPS format, be my guest.
X
XThe procedure "Dotitles" lets you personalize the chart. If you want to
Xmake a whole bunch of blank charts you can replace my supplied text with
Xnothings or with underlines. The procedure "Dodots" is a half-hearted
Xtry at plotting points on the chart; it accepts an array of complex
Ximpedances and labels, and a normalizing resistance. I gave the
XBezier fitter in PostScript a try, but it didn't work so I ripped the
Xcode out. Any takers?
X
XAnyway, it was a interesting exercise, and I think I understand the
Xchart a whole bunch more. Even if you're a total CAE proselyte, when
Xyou print it out and look at it, you'll still get a rush of
Xappreciation for the chart's mathematical beauty and engineering
Xutility.
X
XHave fun & 7'nerds,
XMarshall Jose mjj@stda.jhuapl.edu || WA3VPZ@N2GTE.MD.USA

On a related note, does anyone have schematics for wiring these up to various rigs? I have a D104 w/amp I bought many years ago that has a large 4 pin plug on it. I'd like to hook it up to my KWM-2. Any tips or info would be appreciated.

995. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-15 23:06:16 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.734915176@afit.af.mil>
Source record: 283214

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

I've also been listening without success. I figured it was just my lousy setup (PRO-2006 w/ built-in whip), so I had low expectations. I have managed to hear a local packet station and several hams that either don't know or don't care about keeping the channel clear.

I did read a posting that said one of the school contacts used a directional antenna that was kept pointed at the shuttle.

I beleive you would have better results if the coax was inside a peice of tubing and a stack of ferite beads were placed on the coax just before it entered the tubing.

You know, there is another radio service set aside for the "citizens"
(I am not an American, I am a HAM ;)) called something like GMR (?).
All I know about it is that is is VHF or UHF, you can have repeaters,
you to send a form into the FCC to be legal. Not too popular I guess,
but it IS there! SOMEONE help me out here! :-)

1001. 44th Armed Forces Day Comm Test

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 01:14:02 UTC
From: jdelancy@tecnet1.jcte.jcs.mil
Message-ID: <9304160114.AA26117@tecnet1.jcte.jcs.mil>
Source record: 283223

The following was provided by the Office of the CHIEF NAVMARCORMARS.

QUOTE:
44th ANNIVERSARY OF THE ANNUAL ARMED
FORCES DAY COMMUNICATIONS CELEBRATION

Ref: DoD Directive 4650.2 of 17 Jan 86

1. Purpose. To announce the 44th Annual Armed Forces Day Communications Celebration scheduled for Saturday, 15 May 1993.

2. General. The Army, Navy, Marine Corps and Air Force are co-sponsoring an Amateur Radio Program in celebration of Armed Forces Day per reference (a), featuring the traditional military-to-amateur cross band communications test and message receiving test. The tests give amateur radio operators and short wave listeners an opportunity to demonstrate their individual technical skill and to receive recognition from the Secretary of Defense or the appropriate military radio station for their proven expertise.

a. The proceeding will include operations in continuous wave (CW), single sideband voice (SSB) and radioteletype (RTTY).

b. Participating military radio stations will award commemorative acknowledgement (QSL) cards to amateur radio operators achieving a verified two-way radio contact. Special commemorative certificates will be awarded to anyone who receives and accurately copies the Armed Forces Day CW and/or RTTY message from the Secretary of Defense. All contacts must be acknowledged by QSL card or certificate to validate military interest in these operators.

3. Military-to-Amateur Cross Band Test. Military-to-amateur cross band operations will take place from 15/1300Z (UTC Universal Time) to 16/0200Z (UTC) May 1993. Military stations will transmit on selected military frequencies and listen for amateur radio stations in the amateur bands indicated below. Frequencies assigned below are the "Assigned Frequency". To derive the "Window Frequency" drop 1.5KHZ from the "Assigned Frequency" for USB.

ex: 4005.0 Khz (Assigned Frequency)
- 1.5 Khz

4003.5 Khz (Window/Dial Frequency)

The military operator will announce the specific amateur band frequency being monitored. Duration of each contact should be limited to three minutes.

6. Submission of Test Entries. Transcriptions of the CW and/or RTTY receiving tests should be submitted "as received". No attempt should be made to correct possible transmission errors. The time, frequency and call sign of the military station copied as well as the name, call sign, and address (including Zip Code) of the individual submitting the entry must be indicated on the page containing the test message. Each year, a large number of acceptable entries are received with insufficient information or the necessary information was attached to the transcription and was separated, thereby precluding the issuance of a certificate. Entries must be postmarked no later than 25 May 1993 and submitted to the respective military commands as follows:

a. Stations copying AIR send entries to:

Armed Forces Day Celebration
89 CG/DOJB, Andrews AFB
Washington, D.C. 20331-3645

b. Stations copying NAM, NAV, NMM, NMN, NPL, NZJ and NAV-8 send entries to:

Armed Forces Day Celebration
HQ Navy-Marine Corps MARS
Bldg-13 NAVCOMDET Cheltenham
Washington, D.C. 20397-5161

c. Stations copying AAE, AAH, AAR or WAR send entries to:

Armed Forces Day Celebration
Department of the Army
U.S. Army Information Systems Command
ATTN: ASOP-HF
Fort Huachuca, AZ 85613-5000

Hi!
Does anybody know a Ham radio shop that sells Collins parts and accessaries?
I need to buy a VFO for 75S-3C, some tubes, and some manuals for connecting
75S-3C and 32S-3.
Thanks in advance.

> the front panel, and I haven't seen any mods in the archivers for the 742.
>
> I'm seriously considering one of these for my car, and the mods are
> of some consideration.

Kirk,

I've played with the TM-741 and now own a TM-742. The info I've got is that the mods are NOT the same, although I have not pulled mine apart to perform any mods yet. I've heard that the diode matrix for frequency selection is not in the control head in the 742. Also, since cross band repeat is standard for the 742, one doesn't need a mod to activate this function. Also, I've tried the key sequence to activate the game that is in the 741, and nothing happens on the 742.

One of the major reasons I was even looking a the 741/742 was that there were plenty of channels in the VHF and UHF section to allow scanning of public service frequencies, plus plenty for ham channels. I had been using an Alinco 570 in my car, and had been quite please with it, but with only 10 channels per band, there really wasn't enough memory space to do what I wanted.

The 741 seemed quite prone to intermod on UHF in the 450-460 band, which was quite a disadvantage from my use. I know that any manufacturer doesn't guarantee specs for out-of-band use, but having used several other dual-banders in my car, I realized that some poor design work had gone into the front end section of the 741 making it very broad banded, but giving it very poor selectivity.

The 742 is better in the intermod department. I have little intermod with the 742 in our city's RF alley. However, both the 2 meter out of band and 450 out of band reception is less sensitive than my old Alinco. I also tried to bring my 742 into the house and use it on my outside antennas, and got clobbered by TV hum over most of the UHF 450-460 channels. I'm not sure where this junk was getting into the receiver. My older Kenwood 721A has no reception problems on the same antennas, and my Icom R-7000 and R-9000 do not have any reception problems even on bigger antennas. I can only continue to believe that the 742 has a limited front end rejection for RF out of the intented reception ranges. Be ware of this limitation.

If anyone knows of any mods for the 742, I'd be most interested in hearing from you. Any suprise key combinations that you may discover I'd also be interested in hearing about.

73,
Kirk Baxter, N0FPZ

I think Mouser Electronics sells them. Also, you might try hole saws
(used on drills).

>>I think that we should reallocate a big chunk of 10m to CB. And give them
>>some VHF/UHF also. After all, the "waves" belong to the citizens.

>Gee, and what do you think most of us hams are? WE'RE CITIZENS YOU ASS!

Well, according the "Purpose of Amateur Radio" as codified in part 97, the ham bands are not "citizen's bands". The amateur allocation's scope and purpose are limited (ie. experimentation, public service, international goodwill, no business, etc). The amateur service does not come close to serving all citizens. Of course the users of the amateur service are citizens, but so are the users of the business services. I realize that the FCC is already trying to migrate the amateur bands towards citizen bands by continuing to ease the licensing requirements, allowing personal business, etc. They have publicly stated this intent. That is great, but I think we all would like to see some spectrum remain focused on experimentation, public service, etc. I would rather the new citizen bands be new allocations, but would settle for 10m, etc. being reallocated to CB.

Citizen's bands should be large radio parklands of spectrum set aside for general citizens to use without any content restrictions. This spectrum should serve for personal communications, personal business, and low-level broadcasting. Most importantly, this "parkland" should be available to any citizen; no license required. Of course there would have to be some limits and band plans to avoid total chaos, but the goal should be as little structure as possible.

Remember that the FCC's charter is to "allocate radio spectrum in the greater public's interest...". I think the allocations for public service, business, broadcasting, cellphones, LEO, DBS, amateur, etc. make a lot of sense. However, the allocations for military are much too large, and those for citizen's band are too small. They just don't follow that charter. Everyone I've talked to at the FCC and Congress agrees that there needs to be a change in these areas in this the "decade of mobile communications".

These proposed citizen's bands would not be anything like the 11m band we have today. It can be easily argued that the problems with that band have to do with the psychology of too many people in too small a space and poor band location.

I think we should continue to petition for more citizen bands, otherwise we will be paying $$ to use every bit of *our* spectrum.

>And as to your fondness for talking with the "bootleggers", they are not in
>the amateur radio service. Your license doesn't permit you to broadcast,
>or to communicate with other radio services. (except in the case of an
>emergency, of course.)

In the name civil disobedience, I'll risk it. :->

DEFINITIONS:

Date (day only)
Possible Magnitude of Solar Flaring (LOW=C-class, MOD=M-class, HIGH=M or X)
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
```

Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

```

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

Chart Start: Day #047
```

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts.

Thanks for all the replies.

The list above is what I have after some digging.
I have to assume these frequencies are current and functioning until being told otherwise, as I have no real way of verifying them.

I have also receive some informations on the video retransmissions and SSB/HF retransmissions. I've decided not to include them at this time due to time constraints and concentrated mainly on 2m and 70cm bands. There are some non-amateur band frequencies that I've decided to include as part of the list; you may find them useful if your HT can receive them.

AMSAT OSCAR may be very useful. I can't receive anything on those frequencies. A local ham informed me that I need a very high gain antenna to receive anything from satellites.

If you do get something from OSCAR, or any other 2m/70cm rebroadcasts from satellites, please drop me a note. I am sure many people outside USA will be very interested in your setup.

If you are interested in HF/SSB, there is another list available from N8QLT from compuserve. His email address is 70534,227 on compuserve. N8QLT's list consists of a large collections of aviation band frequencies, NASA contractor frequencies, HF/SSB, and 2m/70m frequencies. There is a large overlap between N8QLT's list and this list.(Not too surprising!)
I think there is a small list of the HF/SSB frequencies that may already exist in the rec.radio.amateur.misc FAQ. Email ikluft@uts.amdahl.com if you want know more.

Finally, if you are satellite capable, you can receive NASA SELECT video direct from satellite F2, transponder 13, with a c-band satellite receiver.
Drop me a note if you have more specific information on the satellite setups. I don't own any satellite gear, so I can't try this out.
Again, if you have details, such as inclinations etc..., drop me a note.

This list is a compilation from personal emails, local lists, HAM BBS files, and words of mouth. You may reproduce and/or distribute this list in any form for non-commercial purposes only. All rules in amateur radio do apply.

Keep sending the frequencies and I'll keep updating the list.

Well, not to add another data point on something that is obviously absurd....

When I took a buddy down to get his novice license - yes he wanted the code
after listing to 2m for so long - there was a woman VE who was helping to
administer the test.

Oh, I almost forgot, my wife and I will be taking the Extra code this Sat,
and then there will be another VE who is a woman. As soon as the paper
can catch up here that is.............. She always wanted to help out
doing the tests. :)

By the way, she is also a big anti-feminist. Discrimination, in any form
that the PC folks like to cloak it in is still discrimination.......

Hello again.
This is the slightly improved list.(Without all the spelling errors!)

If anyone has any luck with AMSAT OSCAR, please let me know.

I am also seeking information for setting up satellite equipments for
receiving NASA SELECT direct.(i.e. orbit info, inclinations, types of receivers
etc...).

Some of you on the net has asked me to put this list on a ftp site.
I am open to suggestions.

A gentleman from Kansas asked me if it is legal (ARRL rule) to rebroadcast
NASA SELECT if it contains music. Music can be heard from time to time
during the press briefings or wake-up callls. I did not have a good
answer for that. Can anyone on the net shed some light on that one?

In the discussion to date, very little has been said about what I consider to be a signifigant subset of amateur discussion, namely antennas. While I consider it signifigant, others may not.

Can someone with a longer expire time on his news spool estimate the number of articles per month on antennas? I presume Ian or someone has already done the calculations.

In my view, r.r.a.antennae (antennas?) ought to include discussion of all kinds of antennas, both theory and construction, and also designs and design programs for antennas. Reviewing the latest program to design your own log-periodic, for example, ought to be covered.

Anyone else for r.r.a.antennas?

>

To be succinct, the advice about confronting the person is garbage.
Certainly most police who are hams would also be smart enough not to get
involved in a federal matter in most cases.

If the person confronted actually was the one creating the malicious
interference, he/she might stop, but it is also quite likely that they will
deny it, & then make sure that the interference continues (perhaps from a
different location, & with the jammer being more cautious) in order to
'prove you wrong' (the logic being that most people would assume confronting
the individual would stop the problem -- if the problem persists, maybe the
confronted individual was innocent...).

If you get on the air & say "We tracked that jammer down! It is
Wilbur Smith, KA7xxx that is interfereing with the repeater!" you run the
strong risk of being sued, and it is really irrelevent as to whether or not
it was Wilbur that was doing the interference.

The thing to do is simply provide all your information to a local
ARRL Official Observer, & let them funnel it to the FCC.

A lot of times, the FCC can't/won't do anything right away, but if the complaints & evidence persist, eventually they will get involved. They'll probably use the information you've provided as a start, & then they will come out with their $30,000 - $80,000 worth of electronic equipment, & gather evidence which will actually stand up in court.

THEY can hold their own ground in court. How well do you think any of us could do on the stand, under cross-examination, & being asked just what exactly makes us experts at RDF, emitter signatures, etc?

We do it as a hobby. Most of our equipment & RDF techniques are sound, but again, we're 'amateurs.'

The FCC are professionals. Many of their field engineers would be happy to explain to you that the only real difference between our $1000 Icom R-7100s & their $25,000 Watkins-Johnson communications receivers is that THEIR equipment holds up in court a lot better than ours would...

How the DTMF masking device work in repeater system ?

When I use the repeater system in Hong Kong,we must send my personnel
access code to the repeater system. During I send my personal access code to
uplink channel, the repeater system automatic send a random string of DTMF code
in the uplink channel to mask and protect my personal access code.
How it work?

Hmmm, curious......

I don't think a carbon microphone is a passive device.

1) AF electrical output power can be greater than incident sound
power (you can demonstrate this by using a carbon mic and an earpiece
as an oscillator, and think about conservation of energy)

2) there is a signal input, a power supply input, and you can
extract an amplified signal output. How about phototransistors ?

The best teachests were always the ones handed down through families, and were originally sent back full of souveneirs by ancestors serving in the British army in India around the end of the last century. Modern ones just aren't as well made.

I now realise that those in the Americas may be somewhat disadvantaged, teachest-wise, and may need to find some acceptable substitute locally. I read that Emmelda (sp?) Marcos is living in the US, but shoe boxes may not be impressive enough.

On a serious note, my grandfather shipped a lot of stuff home from India, we have a lot of family heirlooms as a result. One Aunt blew up when I said that the teachests were nicer than the ornamental table (the table is ebony, and has 3 legs carved as elephant heads and trunks, the horror is that these have genuine baby elephant tusks. It will not enter MY house, ever.) .

Teachests found in America may have been subject to salt water damage and may damage any cards stored in them, if returned, they may not be in good enough condition for their deposits to be refunded, or the tax position could prove difficult.

Have fun
David GM4ZNX

My guess is that there is a consistent flow of postings in this area.
I have not done the calculations but would guess antenna posts would
be at the double digit % level of total postings.

If we believe that cross posting is not a problem (as I do) then I support
subdividing things more than is currently being recommended in options I
or II. I too would like to see a r.r.a.antenna (no plural) group formed
as well as .education, .tcpip, .satellite, .homebrew, .cw, ... I would
much rather weed out the articles on topics that I am not interested in
by having them appear in subgroups to which I do not subscribe. It would
be nice to have a large number of groups, most with a low level of activity,
that people can choose from to suit their own tastes. Perhaps this is not
plausible or economically sound (net-wise) to get implemented.

John, it sounds like you've suffered a seal failure at the upper end.
I say that because you're seeing a sudden severe increase in VSWR
after the storm. Once water gets in the cable and wicks into the braid
you can write the cable off. You won't be able to suck all the water out,
and the braid will corrode.

I've had the best luck with 9913 by putting a glob of vacuum grease in
the cable before installing the connector, crimp type Kings N male, and
using 3M 33 tape followed by a layer of self vulcanizing tape over the
connection. Coax Seal is a mess, and not a terrific seal either. You
should be able to achieve an air tight seal using my method. That'll
keep the humidity out as well as the water.

>What equipment is necessary to make a contact with the space shuttle or
>to even hear it?

I've monitored several Shuttle passes. I'm using a Comet 2X4 Max dual band antenna at 70 feet fed with 100 feet of 9913 from a Alinco 570T. That's my normal terrestrial voice and packet setup. Good strong signals, S9 or better, were received several times. I also caught MIR calling CQ on voice once in the last week, and MIR packet several times. MIR's signals are really strong on good passes. I've got KLM22C and KLM40CX Oscar beams too, with Gasfet preamps and hardline feeders, but they aren't needed for LEO birds (and I can't turn them fast enough on the overhead passes anyway). Maybe when I get the TAPR Trakbox wired up it can keep up better than my two handed manual tracking efforts.

For uplink, a little power is nice. I can work MIR easily with a 160 watt KLM amp on the vertical. I haven't made it to the Shuttle, probably too much competition from the EME crowd. :-) When everyone isn't shouting at once, lower power contacts are probably possible.

>what equipment you used? Thanks for any help you can give.
>
I've heard the shuttle working schools. They don't use the 145.55 frequency for that, but I forget which one I was listening to at the time. I haven't heard any activity on the 145.55 frequency except from the station who has thoughtfully put a PBBS on there (whith a sign-on message of "don't use this during Shuttle or MIR passes." What a saint.) Signal strength was about +40 from a discone and 60 or so feet of line to an old IC-211. You should be able to hear them fine if they transmit anywhere near you.

For the first 5 nights I got up several times in the middle of the night to try and catch them and left the packet station running to at least snag a packet or two if they went over when I wasn't listening. Nothing. I don't think ever turned the packet robot on over New England. These last couple I haven't been listening. (I only have so much stamina.)

These are the breaks of trying to work the Space DX.

=========
SpaceNews
=========

MONDAY APRIL 19, 1993

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* STS-56 SAREX NEWS *
====================
The all-ham crew of STS-56 was successful in making numerous Amateur Radio
contacts with ham radio operators around the world. Several radio contacts
with schools were made, and NASA reported the first contact between the
Space Shuttle and the Russian space station Mir on this latest SAREX mission.

SAREX activity was not as great as had been expected by many ground stations.
Those who copied SAREX transmissions from STS-56, or who were luck enough
to establish two-way radio contact with the Space Shuttle, should direct
their QSL requests to the following address:

STS-56 QSL
C/O Vienna Wireless Society
P.O. Box 418
Vienna, VA 22183

Include a self addressed stamped envelope. Non-US stations should include
the appropriate number of IRCs with your QSL or a $0.50 U.S. stamp on the
envelope.

Report should include callsign, whether worked/heard, date, UTC time, mode,
frequency, and QSO number for packet connects.

* HITEN IMPACT *
================
Dr. J. Watanabe, NAO, reported that the Japanese spacecraft "Hiten" was
expected to impact the Moon at 55.3 E, 34.0 S near Crater Furnerius
(60E, 36S) at 18h03m38s on April 10 UTC, when the terminator is 40.7E.

[Info via Yoshiro Yamada at the Yokohama Science Center, Japan]

* ARSENE NEWS *
==========
The ARSENE satellite is now in Kourou at the space center of the European Space Agency. The team from the Space Radio Amateur Club, including F6FAO Gerard Auvray and F6GXY Didier Delrieu, have joined 22 other engineers in performing the numerous verifications in the ARSENE integration phase. Among the engineers are members of the European Propulsion Society, who constructed the MARS apogee motor; the team from the CNES (National Center for Space Studies) with Jean Pierre Redon, chief of project ARSENE; the team from Aerospatiale who contructed the vehicle; and the Italian teams from FIARE and CISE who fabricated the solar panels and cells.

The carbon-fiber motor, MARS, was placed under pressure after the x-ray photos showed no defects. The starter system, MAGE, was installed. On April 7 the thermal covering was installed on the motor.

The battery went through several charge-discharge cycles so as to maintain optimal performance. The 6 solar panels have been tested and deliver nominal voltage. The umbilical cord between the satellite and the Ariane rocket has been checked. Thursday April 8 ARSENE's third-stage adapter was being balanced.

The first tests of the radio amateur equipment have started.

The ASTRA 1C satellite and the Ariane rocket are in a nominal state for the launch set for April 30. The launch window will open on Friday at 00:52 UTC and close at 01:50 UTC.

Alain Duchauchoy, F6BFH, has accepted the job of Video Project Chief for the launching of satellite ARSENE into orbit. Alain will coordinate the three sequences of 90 minutes of retransmissions on TV satellite ECS2-F1, transponder 39 at 11.658 GHz (KU band). These retransmissions courtesy of France Telecom will take place between 20:30 and 22:00 UTC on three different evenings beginning Friday April 30, 1993. In addition, the ENSAE (the French National College of Aeronautics and Space) at Toulouse will operate an HF station with the special call TM6SUP during the campaigne to launch and position the French radio amateur satellite ARSENE. More details are forthcoming.

SB SAREX@AMSAT $STS-56.019
SAREX QSOs & Kep Set GSFC-026

Folks in the Houston, Texas area report that Ken Cameron was operating voice with battery power during orbit 133 this morning on his pass over the central Texas area. The SAREX team got reports from Gerry Creager, N5JXS and Gil Carman, WA5NOM that KB5AWP was Q5. If SAREX operations continue, you can work Discovery on 145.55 DOWNLINK, and 144.91, .93, .95, .97, & .99 UPLINK over the U.S. and the rest of the World and on 144.80, .75, and .70 uplink over Europe. Please don't transmit on the downlink.

Gil Carman reports that Discovery was approximately 15 seconds early on both AOS and LOS using GSFC-026.

Also, enclosed is the latest Keplerian data for STS-56 as generated by Ron Parise, WA4SIR at the Goddard Space Flight Center.

STS-56
1 22621U 93 23 A 93105.94620954 0.00044106 00000-0 12690-3 0 264

In an article, tim@umcc.umcc.umich.edu (Tim Tyler KA8VIR) writes:
>>> The first thing to do is for all involved in the hunt (the more the merrier) to
>>> go knock on the guy's door and have a group spokesman politely tell him
>>> something on the order of, "we know what you do and we know who you are".
>>> Doesn't always work, but it has in a number of cases. It's worth a try before
>>> resorting to more drastic measures.
>>
>>It should be particularly effective if you know a ham who is also a police
>>officer and let him be the spokesman (in uniform if possible).
>>
>
> To be succinct, the advice about confronting the person is garbage.

Well, if we're going to get nasty, I think *your* advice is garbage.

>Certainly most police who are hams would also be smart enough not to get
>involved in a federal matter in most cases.

What "federal matter" are you talking about? The whole point of the article
you commented on is that you can stop the problem before it becomes a "federal
case", or any kind of legal case at all. The informal intimidation visit
has worked in many, many cases (several documented recently in this newsgroup);
I can't imagine that many jammers continue to interfere once they know they're
found out. Certainly some do, but you just don't hear of it that often and
it's even easier to track them down and record their activities for the FCC
once you know who they are.

> If you get on the air & say "We tracked that jammer down! It is
>Wilbur Smith, KA7xxx that is interfereing with the repeater!" you run the
>strong risk of being sued, and it is really irrelevent as to whether or not
>it was Wilbur that was doing the interference.

I haven't seen anyone suggest doing this. I have heard it announced that
a jammer had been located and talked to, but never have I heard a name or
call given to identify the jammer (that only seems to happen in ARRL bulletins
once the FCC gets involved).

> The thing to do is simply provide all your information to a local
>ARRL Official Observer, & let them funnel it to the FCC.
>
> A lot of times, the FCC can't/won't do anything right away, but if
>the complaints & evidence persist, eventually they will get involved.

Great. So your advice is to quietly sit by and endure disrupted
communications for months when a quick visit to the offender would most
likely stop the problem immediately? Rubbish.

> THEY can hold their own ground in court. How well do you think any
>of us could do on the stand, under cross-examination, & being asked just
>what exactly makes us experts at RDF, emitter signatures, etc?

Again, you're off commenting on suggestions that nobody has made. A visit to a jammer's house by a group of hams is not a trial. It will most likely make one unnecessary, in which case we all (as taxpayers) win.

1037. Earmics, motorcycles

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 16:47:02 UTC
From: jfh@netcom.com
Message-ID: <jfhC5L5AF.Er9@netcom.com>
Source record: 283109

I would like to be able to use my HT on my motorcycle. After looking around, I decided that the Comet earmic (ML-7I) would be the way to go. I called Comet to ask whether it would work with a Yaesu FT-530, and was told that it would. I ordered one from AES.

When it arrived, I discovered that it did not, in fact, work. I called Comet again. The person I talked to said that it should work, but that he would call Yaesu to discuss it. Yesterday he called back to say that it wouldn't work on the FT-530, although it would work on some other Yaesu's.

So, what now? Does anyone else make an earmic? (An earmic is a combined speaker/microphone that fits in your ear canal. It has a separate PTT switch on a cord.) I think I've heard of in-ear microphones from other manufacturers, but I can't remember who they were. Does anyone know? One which has the mic in one ear and the speaker in the other would be ideal, since it should be possible to have VOX.

Any other suggestions for motorcycle riding? I use a full-face helmet, and I don't want to drill holes in it.

1038. Motorola Motrac tuning info requested

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 17:21:58 UTC
From: syspt@tesla.njit.edu
Message-ID: <1993Apr16.122158.1@tesla.njit.edu>
Source record: 283110

I'm converting an old Motorola Motrac from 460 down to 440. I do have
a "Motrac" 450-470 manual however it does not seem to be the same version
radio. The schematic is dated 1970 and the radio is dated 1965.

Does anyone one have a schematic / tuning instructions for this old Motrac?
One way to check is with L1-L6 on the rcvr's front end. On my 1965 radio
L1-L5 are "screw type" coils. L6 is a standard coil.

On my 1970 manual L1-L6 are all "screw type".

Also, I suspect I will have to change a cap in the multiplier stages.

Any info would be appreciated.

Please respond to syspt@admin1.njit.edu

Thank you,
Pete ww2i.

1041. Saturn radio installation tips wanted

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 17:57:33 UTC
From: mje@pookie.pass.wayne.edu
Message-ID: <1qms2d$74s@vela.acs.oakland.edu>
Source record: 283111

I've just ordered a Saturn SL1, and I'll be installing VHF and HF radios in it. Running a power bus to the fuseblock looks wonderfully straightforward, but I wonder if anyone has any tips on mounting the radios themselves in a Saturn? Replies direct, please, to:

mike KE8YY mje@pookie.pass.wayne.edu

tnx es 73

1042. Re: How the DTMF masking device work?

> How it work?
>
There is usually a delay line in the receivers audio chain.
Once the presence of DTMF tones is detected, the audio
is squelched or masked before it hits the transmitter.
Most repeaters here will either simply squelch-off the audio;
some will insert "beeps" to inform the audience of someone using
DTMF.

Tony what exactly is a NO-CODE BOZO?
Is that like an Extra Class BOZO?

I am sure that if you check around you might find some General and Novice
BOZO's also.

>
As further proof of amplification, there were some pre-electronic attempts to build telephone repeaters consisting of essentially a receiver and a carbon transmitter sharing a diaphragm. I don't believe these were successful as repeaters because of the noise introduced; but I've actually seen such a device used in an oscillator, as a tone source for test equipment.

1046. AN/GRC-109

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 18:45:00 UTC
From: COWANR.ZAMA@zama-emh2.army.mil
Message-ID: <9304160307.AA08312@ucsd.edu>
Source record: 283081

Jim ask what this was.

The AN/GRC-109 is a compact,portable HF radio set used for CW communications under a wide range of climatic conditions. Transmissions can be made using the built-in hand key, an external hand key, or an external, high-speed automatic keyer such as Coder-Burst Transmission Group AN/GRA-71. Two power supplies and a voltage regulator permit operation from a variety of power sources.

Freq Range Trans 3-22 MHZ
Rec 3-24 MHz
Number of channels 24,crystal controlled
Power Input 75 to 260V AC, 40 to 400 Hz or 6V DC
Power Source Any appropriate AC power source, generator DC G-43/G, 6-V DC wet or dry battery
Power Output 10 to 15 W
Squelch None
Type of Service Transmit, 0.1A1
Weight 25.2kg (55.5lb)

The AN/GRC-109A would mean that the basic 109 had been modified. I don't know what the mod was.

Have fun.

1047. Where to find solid state voice storage unit kit or schematic?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 18:45:19 UTC
From: kshus@schunix.uucp
Message-ID: <1993Apr16.184519.13807@schunix.uucp>
Source record: 283122

I want to build a solid state voice storage unit to use in an industrial situation. I am looking for a quality, high tech design that offers great audio quality (I don't want compressed, recorded sounding audio). I remember seeing a design in QST along with a parts list. Can anyone tell me what issue of QST described this unit? Has anyone had any experience with the Ramsey unit? I don't want a cheapy type kit that

| A lot of times, the FCC can't/won't do anything right away, but if
|the complaints & evidence persist, eventually they will get involved.
|They'll probably use the information you've provided as a start, & then
|they will come out with their $30,000 - $80,000 worth of electronic
|equipment, & gather evidence which will actually stand up in court.
|
| THEY can hold their own ground in court. How well do you think any
|of us could do on the stand, under cross-examination, & being asked just
|what exactly makes us experts at RDF, emitter signatures, etc?

Usually they don't have to hold any ground in court. They just levy
fines or revoke licences as they see fit. Other federal government agencies
simply confiscate property. There is no court case involved. (ATF,
DEA.) Constitutional provisions against unreasonable searches & seasures?
Never heard of 'em. ;^) Further more, nobody gets to sue the federal government
(in otherwords nobody has "standing" to sue) unless the congress grants
it. Congress can say (and often has said) that the federal government will
not be sued on certain issues (like indian treaties.)

1049. 6m R/C specifications?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 18:56:33 UTC
From: ericf@soul.tv.tek.com
Message-ID: <1993Apr16.185633.20416@tvnews.tv.tek.com>
Source record: 283116

Can anyone point me in the right direction for finding out information on
Radio Controlled (Airplanes, etc) specifications for the 6m band?

I'm interested in the modulation specs, standard channel assignments, as well
as TX / RX construction articles.

This is all just a matter of definition, but a carbon mic
is a linear circuit element, no different from a simple fixed
resistor, or a rheostat. You might as well say that a
potentiometer is an active device because it "amplifies";
I can control many watts of electrical power with just the
flick of a finger. Yet I don't think anyone would argue that
a pot is an active device.

>I posted a similar question earlier and got no response so I'll try
>again.
>
>What equipment is necessary to make a contact with the space shuttle or
>to even hear it?

I've conected to the shuttle using my Kenwood TR-2600A HT running
less than 5 watts to a 2m J-Pole antenna at about 20 feet. I was
using my MFJ1274 TNC (obviously a packet QSO).

My experience says that you don't need lots of fance equipment or
setups. But you will certainly have an easier task of it with
higher power and better antennas. It took quite a few tries to make
the above contact.

Hello Chris,

We had a SAREX scheduled contact on STS-47 in Sept. '92. The setup was from
a 'earth station' with a trackable antenna system. This provided us with
(below-horizon) scatter-to-scatter contact with Endeavor for about 12 minutes.

We also had a j-pole hooked up and monitored the downlink. We heard 80-90 %
of the downlink.

The best approach for successful contact is a computer-controlled steerable
antenna system.

Also, VERY IMPORTANT, be sure your deviation is 3 Khz. Doppler will add another
3 Khz at the horizon and you'll be slightly out of their passband then !

If I can be of further help, let me know.

73s es Good Luck !! N4ZBB

Jack-

A better question might be: Why doesn't it work? Is it merely a wiring
problem that might be easily corrected? Could an adapter be built that
would match the wiring and/or impedances?

I was interested in an ear-microphone for other purposes, and collected
what information I could find at the recent Mobile Communications Expo.
The following three companies have products that may meet your needs:

Variety Electronic, Inc.
1977 O'Toole Avenue B-106
San Jose, CA 95131
(408)383-1666
FAX (408)383-1668

Sonic Communications, Inc.
#4 Colonial Center, Box 287
New Ipswich, NH 03071
(603)878-1944
FAX (603)878-1773

Dynatech Tactical Communications, Inc.
16 Hampshire Drive
Hudson, NH 03051
(603)880-4411
(800)233-8639 Outside NH
FAX (603)880-6965

I would worry about any of these companies, until they showed me their
product was compatible. They may all actually be importing the same device
as Comet!

1057. Cable TVI interference

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 20:57:13 UTC
From: jim@sys6626.bison.mb.ca
Message-ID: <3X842B1w165w@sys6626.bison.mb.ca>
Source record: 283031

Oh golly gee, have I a story to tell.

Locally, our Cable Tv company distributes A&E Cable on 17, and TNN on 18.

I live in Downtown Winnipeg, amongst all the VHF pagers. The pagers cause all sorts of twisting lines on 17, so bad that A&E is unwatchable at times (less during weekends).

It's been like this for me since I moved here in November 1990. Videon Cable (owned by Moffatt Communications) was here Spring '92 to replace the inside co-ax from my Tv to the outside.

This year, sometime in late February, for about 3 weeks I noticed a BIG improvement in the signal quality of 17, 18, and 21 (Tv5 - French from Paris). Then, on March 9th the signals wen't back to "normal" on 17, 18, and 21. A local CBer across town mentioned that his signal had been entering the cable system. He said that DOC (like the FCC) had been down to check out the guy's equipment and later found that it was the CABLE COMPANY employee who had installed a cable distribution amp. in backwards. When that happens all the cable amps. up to a certain distance blow out. The cable company finally fixed his problem.

Upon hearing this story on CB (ch. 25 - Seniors and young Amateurs channel 11 pm - 1 am local), I called Videon to tell them I'm having problems on 17, 18 and 21. They were here for 3 days in mid-March this year and replaced alot of coax outside the 3-storey walkup where I live. The pager intermod on 17 would disappear for a short while (30 mins - 2 hours) and then would get "progressively worse."

On their 3rd visit I even called Department of Communications (DOC) to see if they could do anythiing. All the guy there said was "give them a chance."

I finally gave up on the company, can't watch A&E (usually Improv), and decided to wait until they fix it like they did in February.

BTW: On March 9th I saw a Videon Cable truck with a mechanical ladder on top a block from me going down the street. It seems they must have done something nearby on that day, but won't own up to it.

Jim - frustrated, like the rest of us.

Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1993/04/09 20:30 $
Version: $Revision: 1.03 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
a unique Message-ID, is propogated across the net). This tag also facilitates
a pre-existing method of dropping or cancelling the articles locally within the
discussion groups if you don't want to see them. This accommodates individuals
who want to separate the bulletins from the discussions, discussions from the
bulletins, as well as those who are adamant about not reading another
newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic)
doubling every year or so, this is no insignificant contribution to reducing
information noise and chaos. Making the discussion groups a catch-all, and
making extra newsgroups filters on that catch-all, is also the most realistic
way to implement such a scheme (It's not intuitively obvious what the charter,
contents, and general appropriate topics for each and every newsgroup are.

Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:

rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail.
If you leave the address portion blank, it will try to deduce your address
from the mail headers. This may not work if you are on bitnet, milnet or
some other non-Unix host, so it is recommended to put your return address
in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as
numbered files.

Effectively this means that anything you post to rec.radio.info will be
permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are
willing to take responsible people and provide them the means of posting the
articles directly from their site. We will try everything we can as we fully
realize that DX (distant signal) and astronomical data can be somewhat
transitory. We are also willing to allow regular posters of information the
same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for
news.answer. This requires co-operation and good will to be beneficial to
the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to
suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu

Jack Hamilton (jfh@netcom.com) wrote:
& I would like to be able to use my HT on my motorcycle. After looking
& around, I decided that the Comet earmic (ML-7I) would be the way to go. I
& called Comet to ask whether it would work with a Yaesu FT-530, and was told
& that it would. I ordered one from AES.

I have used a Maxon earmike with homebrew electronics with my FT-470.
It worked fine until I put it on the motorcycle. The earmike needs an
amplifier to pick up the sound of your voice coming through your head
to your ear. It also amplifies the wind noise in the helmet. It
turned out to be useless on the motorcycle unless I was stopped or
going *very* slow. At 25 mph it was ok, 35 mph was pretty noisey,
by 50 mph my voice was 100% no copy. I have a Bell Star helmet and
no fairing on the bike.

1062. Re: 9913 Equivalent Water Trouble

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 21:48:50 UTC
From: bat@gdstech.GRUMMAN.COM
Message-ID: <BAT.93Apr16164850@gdstech.GRUMMAN.COM>
Source record: 282804

It is rumored that the condensation enters 9913 thru it's skin. It supposedly breathes a bit more than it should. So, you may not have a connector problem. But, I'm going to open up another sore topic, about coax which has had water thru it. I firmly believe that once water wicks its way thru the braid, oxidation will start, and the braid will deteriorate over time. Even if you could dry the coax out by forcing warm, dry air thru it, my opinion is, you're wasting your time. You shoud discard that coax, as you can't really stop the oxidation of the braid. Some broadcast engineers on this net have told me that I'm crazy, but I have seen this happen a few times. If you are going thru the trouble of taking the coax down from the tower, I recommend replacing it. 9913 should come with warnings about burying it, or putting it in damp conduits. My opinions..

Satellite: STS-56
Catalog number: 22621
Epoch time: 93106.63589010 (16 APR 93 15:15:40.91 UTC)
Element set: GSFC-027a
Inclination: 57.0020 deg
RA of node: 139.9839 deg Space Shuttle Flight STS-56
Eccentricity: 0.0008736 Keplerian Elements
Arg of perigee: 142.8313 deg
Mean anomaly: 217.3372 deg
Mean motion: 15.95688009 rev/day Semi-major Axis: 6664.5302 Km
Decay rate: 0.53E-03 rev/day*2 Apogee Alt: 291.96 Km
Epoch rev: 135 Perigee Alt: 280.32 Km

NOTE - This element set is based on NORAD element set # 027.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

bly@btree.uucp (Roger Bly) writes:
: stated this intent. That is great, but I think we all would like to see some
: spectrum remain focused on experimentation, public service, etc. I would
: rather the new citizen bands be new allocations, but would settle for 10m,
: etc. being reallocated to CB.

Why 10m? You would just have the same problems that occur on the current
11m band. It should be put up around 700Mhz - where skip is not a real
problem. After all, CB is supposedly for local communication.

: Remember that the FCC's charter is to "allocate radio spectrum in the greater
: public's interest...". I think the allocations for public service, business,
: broadcasting, cellphones, LEO, DBS, amateur, etc. make a lot of sense.
: However, the allocations for military are much too large, and those for
: citizen's band are too small. They just don't follow that charter.
: Everyone I've talked to at the FCC and Congress agrees that there needs to
: be a change in these areas in this the "decade of mobile communications".

Ten or twenty years ago, during the CB craze, this would have been true.
Now, DB is not used nearly as much. If I had my way, I would phase out
11 meters over a period of 10 years or so and reassign CB to a UHF band.

: These proposed citizen's bands would not be anything like the 11m band we
: have today. It can be easily argued that the problems with that band have
: to do with the psychology of too many people in too small a space and poor
: band location.

A lot of it was due to the band - 11 meters. It would not have been nearly
as popular, nor would there have been all the amplifier problems, if skip
did not exist on the band.

: >And as to your fondness for talking with the "bootleggers", they are not in
: >the amateur radio service. Your license doesn't permit you to broadcast,
: >or to communicate with other radio services. (except in the case of an
: >emergency, of course.)
:
: In the name civil disobedience, I'll risk it. :->

It's your neck.

1066. Heavy-duty antenna simulation software

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-16 22:44:58 UTC
From: ddr@flux.isr.alaska.edu
Message-ID: <1993Apr16.224458.12882@raven.alaska.edu>
Source record: 283030
Cross-posted to: rec.radio.amateur.misc,sci.electronics

I would be interested in hearing from anyone who knows of good software for antenna simulation, particularly in source form suitable for Unix workstations (though good PC software would also be of interest).

I'm aware of the numerous mininec mutations, and have been using MN for some time now. I'm primarily interested in HF, VHF, and low UHF (< 500 MHz) designs, mostly wire antennas, but for thick wires and mesh surfaces as well as for your basic thin wire assumption.

Is anything interesting happening with NEC itself? I've seen a version that was mutilated to run (sort of) under Microsoft Fortran, but I'm not sure how many "new and improved" versions of the code might be out there somewhere.

I'd also be interested in non-NEC derivatives. The ones I've seen have been aimed at microwave applications, but if there is something out there useful at the lower frequencies, I'd like to know about it.

Thanks,

could anyone suggest ftp sites and sources for mac and IBM
CW programs. I would like programs where I could speed up the
characters but slow down the spacing to help increase my
cw speed from 15 to 20 WPM! Any suggests about increasing
would be welcomed also. 73's

1069. Stolen Car

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-17 01:36:07 UTC
From: sehrlich@lynx.dac.northeastern.edu
Message-ID: <1993Apr17.013607.19998@lynx.dac.northeastern.edu>
Source record: 283034

I offered to relay this information for a ham friend of mine without
Internet access:

His name is Robert (Bob) Wondolowski, N1KDA, and his car was a
1985 Brown Cutlas Sierra Sedan, Massachusetts plate 716ADL.

His HT (Yaesu FT415) and mobile antenna were also included in the car.
It was stolen from Lynn, Mass. about 10 days ago (being on April 6).

If anyone has any information about the car's whereabouts, please e-mail
me.

Thank you for taking the time to read this message.

1070. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-17 03:03:43 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.735015823@afit.af.mil>
Source record: 283036

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

1071. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-17 03:06:38 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.735015998@afit.af.mil>
Source record: 283035

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

ZCZC AP76
QST DE W1AW
PROPAGATION FORECAST BULLETIN 15 ARLP015
FROM TAD COOK, KT7H, SEATTLE, WA
APRIL 16, 1993
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SB PROP ARL ARLP015
ARLP015 PROPAGATION DE KT7H

SOLAR FLUX DROPPED DRAMATICALLY THIS PAST WEEK. ON THE DAY THAT
THIS BULLETIN WAS WRITTEN, THE FLUX HAD SUNK ALL THE WAY TO 88,
WHICH IS LOWER THAN IT HAS BEEN IN A LONG TIME. THIS IS A PREVIEW
OF EVEN LOWER FLUX VALUES THAT WE WILL OBSERVE OVER THE NEXT FEW
YEARS. THIS TRANSLATES TO LOWER MAXIMUM USABLE FREQUENCIES AND
LESS WORLDWIDE PROPAGATION.

THE GEOMAGNETIC FIELD RANGED FROM QUIET TO UNSETTLED OVER THE PAST
WEEK, WITH K INDICES AS LOW AS ONE ON SOME DAYS, AND UP TO FIVE ON
OTHERS.

SOLAR FLUX SHOULD REMAIN LOW OVER THE NEXT WEEK, AND THEN START TO
PICK UP AFTER APRIL 23. IT WILL PROBABLY PEAK NEAR 140 AFTER THE
END OF THE MONTH, AND THEN GO DOWN AGAIN. THERE IS A CHANCE OF
SOME DISTURBED CONDITIONS THIS WEEKEND, CENTERED AROUND APRIL 17,
AND AN EVEN GREATER DISTURBANCE AROUND MAY 2.

SUNSPOT NUMBERS FROM APRIL 8 TO 14 WERE 145 134, 118, 90, 56, 39
AND 40, WITH A MEAN OF 88.9. 10.7 CM FLUX WAS 143.1, 135. , 139,
118.8, 103.2, 97.2 AND 92.2, WITH A MEAN OF 118.4.

THE PATH PROJECTION FOR THIS WEEK IS FROM CLEVELAND, OHIO TO THE
CONGO.

80 METERS SHOULD BE OPEN FROM 2300 TO 0530Z, WITH THE BEST
CONDITIONS FROM 0100 TO 0430Z. 40 METERS SHOULD BE OPEN FROM 2200
TO 0600Z, PEAKING FROM 2300 TO 0530Z. 30 METERS SHOULD BE OPEN
FROM 2100 TO 0500Z, WITH BEST CONDITIONS FROM 2230 TO 0300Z.
20 METERS SHOULD BE OPEN FROM 1900 TO 0230Z, WITH BEST CONDITIONS
FROM 2100 TO 0200Z. 17 METERS SHOULD BE OPEN ON SOME DAYS FROM
```

1600 TO 2300Z, AND 15 METERS OPEN ONLY MARGINALLY FROM 1900 TO
2130Z. CONDITIONS DO NOT LOOK GOOD FOR 12 OR 10 METERS.

>

I have an old Bell full face that I modified to take both a microphone
and speaker elements. I used a mic element from an old dynamic mic, and
the speakers from a thin pair of headphones. To mount 'em I carefully cut
away some of the foam padding (not the hard stuff next to the helmet
shell, just the "comfort padding") and glued in the speakers. The mic is
installed in the lower "crossbar" of the helmet. All this is fed with a
regular mic cord to a 1/4 in stereo phone jack. The cord itself is
mounted with a plastic wraparound bracket to the helmet. (All right, I
drilled one small 1/8 in hole in the helmet. I also made sure the hole
was clean, no burrs, etc.)

I've had it this way for about five years, now.

Robert Smits There is *no* idiotproof filter.

APRIL 16, 1993
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SB QST ARL ARLB043
ARLB043 RF EFFECTS DOCKET

THE FCC HAS RELEASED A NOTICE OF PROPOSED RULE MAKING TO UPDATE
GUIDELINES AND METHODS USED FOR EVALUATING THE ENVIRONMENTAL
EFFECTS OF RADIOFREQUENCY RADIATION, BASED ON NEW RF EXPOSURE
STANDARDS ADOPTED BY THE AMERICAN NATIONAL STANDARDS INSTITUTE,
IN CONJUNCTION WITH THE INSTITUTE OF ELECTRONIC AND ELECTRICAL
ENGINEERS, IN 1992.

IN 1985 THE FCC ADOPTED 1982 ANSI GUIDELINES, WHICH RESULTED IN
SOME TRANSMITTING FACILITIES BEING REQUIRED TO PREPARE AN
ENVIRONMENTAL ASSESSMENT IF THEY WOULD EXPOSE HUMANS TO RF LEVELS
GREATER THAN THOSE RECOMMENDED BY THE GUIDELINES. UNDER THE 1985
GUIDELINES MANY LOW-POWER, INTERMITTENT, OR NORMALLY INACCESSIBLE
RF FACILITIES WERE EXCLUDED FROM THE FCC'S RULES, INCLUDING AMATEUR
RADIO STATIONS.

THE NEW, 1992 ANSI GUIDELINES IN MANY RESPECTS ARE MORE RESTRICTIVE
IN THE AMOUNT OF RF PERMITTED AND THEY ALSO EXTEND THE FREQUENCY
RANGE UNDER CONSIDERATION FROM 3 KHZ TO 300 GHZ. THE NEW
GUIDELINES ALSO SPECIFY TWO SETS OF EXPOSURE RECOMMENDATIONS, ONE
FOR ''CONTROLLED ENVIRONMENTS'' (USUALLY INVOLVING WORKERS) AND ONE
FOR ''UNCONTR LLED ENVIRONMENTS'' (USUALLY INVOLVING THE GENERAL
PUBLIC).

HAND-HELD DEVICES ARE TREATED FOR THE FIRST TIME IN THE NEW ANSI
GUIDELINES. THE 1982 GUIDELINES INCLUDED EXCLUSIONS FOR DEVICES
THAT DID NOT EXCEED A ''SPECIFIC ABSORPTION RATE'' (SAR) OR WHOSE
INPUT WAS 7 WATTS OR LESS. THE 1992 GUIDELINES ALSO CONTAIN
LOW-POWER EXCLUSIONS, BUT THEY ARE MORE STRINGENT AND COULD REQUIRE
MANUFACTURERS TO DEMONSTRATE COMPLIANCE WITH SAR REQUIREMENTS.
```

THE COMMENT DATE IN THIS DOCKET, ET 93-62, IS AUGUST 13, 1993.
THE REPLY COMMENT DATE IS SEPTEMBER 13, 1993.

SB QST ARL ARLB044
ARLB044 PROPOSAL FOR 902 MHZ

THE FCC HAS ISSUED ITS NOTICE OF PROPOSED RULE MAKING TO ALLOW THE EXPANSION OF AUTOMOTIVE VEHICLE MONITORING (AVM) SYSTEMS THROUGH THE CREATION OF A NEW LOCATION AND MONITORING SERVICES (LMS) IN THE 902-928 MHZ BAND.

THE NPRM, IN PR DOCKET 93-61, WOULD MAKE MORE USERS ELIGIBLE FOR LMS SERVICES AS WELL AS MAKING PRIVATE CARRIERS ELIGIBLE FOR LICENSES. THE FCC NOTES THAT THIS EXPANSION ''COULD LEAD TO RAPID CONGESTION OF AVAILABLE SPECTRUM.''

AMATEURS CURRENTLY SHARE THIS BAND WITH GOVERNMENT RADIOLOCATION, FIXED, AND MOBILE SERVICES. THE FCC NOTES THAT INTERFERENCE FROM ALL OF THESE SERVICES, INCLUDING AMATEUR, TO THE EXPANDED LSM SYSTEMS IS POSSIBLE.

THE FCC ALSO ASKS FOR COMMENTS FROM POTENTIAL LMS USERS ON WHETHER ''THEY BELIEVE IT POSSIBLE TO ESTABLISH RELIABLE LMS SYSTEMS CONSIDERING THE NUMBER AND DIVERSITY OF OTHER USERS OF THIS BAND.

''IF NOT, COMMENTERS SHOULD OFFER POTENTIAL SOLUTIONS, SUCH AS REMOVING PART 15 USERS AND AMATEUR OPERATIONS FROM THE BAND, RESTRICTING WHERE SUCH USERS COULD OPERATE IN THE BAND, OR PLACING STRICTER LIMITATIONS ON THE OPERATIONS IN THIS BAND,'' THE NPRM SAYS.

THE COMMENT DATE IS JUNE 29, 1993. REPLY COMMENT DATE IS JULY 14, 1993.

1077. 30 second Terrain Dbase, where?

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-17 05:17:17 UTC
From: martija@wkuvx1.bitnet
Message-ID: <1993Apr17.001717.6898@wkuvx1.bitnet>
Source record: 283053

Does anyone know where to get the 30 second USGS Terrain
DataBase via FTP? How about a HAAT Utility or a coverage plotter
based on freq, ERP and HAAT?

Thanks,
Jeff Martin, N5KOL

>In the discussion to date, very little has been said about what I
>consider to be a signifigant subset of amateur discussion, namely
>antennas. While I consider it signifigant, others may not.

You suggested it and it was on the 4/14 "evolving proposal" as a newsgroup under discussion. So it's tentatively on the proposal (to become the CFV) as long as there continues to be no serious opposition.

I noticed John Thompson expressed support for it but that may not have reached you at the time you wrote that... (He's downstairs in the same building as me so his articles don't have to go anywhere before I can read them.)

>Can someone with a longer expire time on his news spool estimate the
>number of articles per month on antennas? I presume Ian or someone has
>already done the calculations.

In the original analysis done on the rra-reorg mail list, antennas were the #3 topic before being split between the #2 and #4 topics (products/equipment and homebrew/contruction, respectively.) In our sample, antennas were included in 10% of the traffic. I suspect that's why there's been no opposition.

The only reason it wasn't on the RFD was because we were trying to keep the newsgroup count down. It was one that folded well into the other two topics.

I have a script that copies any articles in news.groups with radio in the subject. (I also had to add a string search for "r.r.a" when this thread appeared. :-) I'll do a new tally when I'm done with this pass through news.groups.

>In my view, r.r.a.antennae (antennas?) ought to include discussion of all

antennae are for insects :-) radios have antennas. An "e" is typically used like this in Biology and by a certain former US Vice President that helped the media sell a lot of newspapers.

>kinds of antennas, both theory and construction, and also designs and
>design programs for antennas. Reviewing the latest program to design your
>own log-periodic, for example, ought to be covered.

>Anyone else for r.r.a.antennas?

Like I mentioned, I saw more articles about it. If it's as I remember that there is a handful of supporting articles and no opposition, then it will become part of the proposal with tonight's tally. (It probably took the recent few articles to elevate it to that category, though.) More details when I'm done counting.

>and it's very corrosive to copper. You shouldn't use that around electrical
>wiring.
>
According to a tube of T-60 Electrically conductive RTV by SWS
Silicones Corp of Adrian MI, it releases cyclohexylamine . I'm
pretty sure this stuff doesn't damage wiring :-).

I've heard that RTV is used by TVRO companies to dielectrically
tune circuits because it has the same constant before and after
tuning. Ward/Britain p.39 92 Microwave Update.

1081. Size TS50 packing

Newsgroup: rec.radio.amateur.misc
Date: 1993-04-17 08:37:31 UTC
From: dihi@bsdihi.atr.bso.nl
Message-ID: <735035851snx@bsdihi.atr.bso.nl>
Source record: 283057

On my question about importing a TS50 from the states I got a lot of reactions. The most attractive ones suggested to buy a cheap ticket to Florida and buy the equipment there. From the money saved it was suggested to spend it as a holliday.... Creative!

The most practical option is to let somebody buy the set in the US and have it shipped over. To find out what the shipping fare will be I need to know the size and weight of a TS50 in its original packing.

So, who just bought one and help me out with this question?
Thanks,

Dick Hissink PA3DSP

THE MAJOR NEWS ITEMS THIS WEEK

Did You Get Your Annual Report?
Meet the Candidates
Ballot Papers for Council Elections
Uganda on the Air
Fox Hunting on TV
ARSENE Undergoing Pre-Launch Checks
Power Games

DIVISIONAL NEWS

The Division's Annual Report for 1992 was inserted into the April issue of "Amateur Radio" magazine, mailed to members before Easter. However,it seems that the Annual Report missed being inserted in some members' copies of "AR".

If you did not receive an Annual Report with your "AR", please WRITE to or FAX the Divisional Office, and a copy will be sent out to you.

Write to PO Box 1066, Parramatta, NSW 2124, or send your fax to (02) 633-1525.

MEET THE CANDIDATES

At the Divisional Council meeting of 15th April, it was resolved that a "hustings", would be held at which members could meet candidates for the next Divisional Council.

The meeting will be held at Amateur Radio House this Wednesday evening, 21st April, during the normal opening hours of 7 to 9pm. This is your chance to better understand and discuss the policies of the candidates; we urge all members to take advantage of this opportunity.

BALLOT PAPERS FOR COUNCIL ELECTIONS

The ballot papers for the election of Divisional Councillors for 1993-94 have been prepared by the Returning Officer, Peter O'Connell VK2EMU, and will be posted to members over this coming week.

The posting of ballot papers was advised on page one of your Annual Report, which was inserted in the April issue of "AR" magazine, posted to members the week before Easter.

Please read the instructions carefully, and make sure you understand them, before filling out the ballot paper and returning it.

You must register a vote for NINE candidates -- no more, no less -- else your ballot paper will be declared invalid.

The full agenda for the Annual General Meeting of the Division is included with the mailing.

Just a reminder -- the AGM will be held on Sunday, the 9th of May, at Amateur Radio House, 109 Wigram Street, Parramatta, commencing at 2.00 pm.

(The Divisional News items this week were from Bob Lloyd-Jones VK2YEL, Divisional Secretary)

The next Divisional Council meeting will be after the AGM, on Friday 14th May.

DX NEWS

Paul VK6PY tells us (via Daron Cook VK2MMR) that Ugandan station Bruno 5X1A will be looking for VK and ZL contacts on 10 metres, this evening (18th April), and possibly next Sunday the 25th.

Bruno will be active on a frequency of 28.380 MHz, starting from 0930 UTC. His QSL information is Box 3316, Kampala, Uganda.

African stations tend to be a bit rare on the bands, and thos specifically looking out for VKs even more so. Once again, look out for Bruno 5X1A, this evening, and possibly next Sunday evening, starting at 0930 UTC (7:30pm local time) on a frequency of 28.380 MHz.

-- Thanks to Daron VK2MMR for that DX tip

GROWTH IN JAPANESE AMATEURS

The number of Amateur Radio operators in Japan had reached almost one and a quarter million by September last year. With 1,242,550 stations licensed, Amateurs represented nearly one-sixth of all radio and communications stations licensed in Japan at the time.

In the three months between June and September. the number of Amateur licensees grew by 20,336 - that's more than the total Amateur population of Australia!

-- Roger Harrison VK2ZTB

FOX-HUNTING ON TV

The publicised fox hunting feature on Channel 9's Wide World of Sports (Sports Sunday) program has been deferred nearly as often as the STS-55 mission... Andrew VK3KIR tells us the segment will probably go to air next weekend.

The seven and a half minute segment sounds rather tongue in cheek, as it features a stuffed fox named Basil who comically appears in quite a few shots, checking out what the VK3s get up to.

For up-to-date information, call contact Andrew VK3KIR on (018) 354-644.

SPACE NEWS

Bernard F6BVP reports that the ARSENE satellite is undergoing pre-flight tests at the Eurpoean Space Agency Space Centre in Kouru, French Guiana. The Radio Amateur Club de l'Espace team members Gerard F6FAO and Didier F6GXY are assisting ESA engineers during integration phase.

The satellite is scheduled for launch on 30 April, between 00:52 UTC and at 01:50 UTC.

Bill Magnusson VK3JT will have details on ARSENE, in his AMSAT column of "Amateur Radio" magazine.

-- Bernard F6BVP

POWER GAMES

Colin VK2DYM tells us that a recent FCC survey of the homes of a number of American Amateurs revealed local field strengths of up to 9 volts/meter. Colin say these levels should be enough to keep the neighbours warm all winter!!

Manufacturers and importers of electronic consumer goods are using the survey findings to lobby for reduced Amateur power levels, so they don't have to do so much on EMI suppression for their products. They're pushing for maximum field strengths of no more than 0.9 v/meter, which corresponds to an Amateur power level of only 10 Watts.

Meanwhile, ARRL Bulletin number 40 reports that the American Federal Communications Commission turned down an Amateur's request to run more than the legal power limit. Dale Gagnon KW1I had applied to operate on AM at a PEP power more than 1,500 Watts output.

In denying the request, the FCC said that Gagnon had "not shown that his circumstances are unique nor [had he] presented any facts that would warrant a waiver."

WICEN NEWS

Don't forget that WICEN renewals are now due, and you must renew by 30th September, otherwise your membership will expire.

WICEN Sydney South meets on Tuesday, and WICEN Sydney North's AGM is on Wednesday at Ku-Ring-Gai SES. Please note that there is a "typo" in the Sydney North posting; the AGM is on the 21st, not the 20th as indicated.
